Other Projects

Core holds a portfolio of tenements in the Northern Territory and South Australia which are prospective for a variety of commodities, including base metals, rare earth elements and gold.

Shoobridge Lithium Project

Location: Northern Territory • **Ownership:** 100% CXO • **Commodity:** Lithium

Shoobridge is located about 160km south-southeast of Finniss near Darwin in the Northern Territory. The project is located in Pine Creek Orogen and lies within the Tipperary pegmatite district, including the Shoobridge pegmatite field and the Plateau Point pegmatite field.

Shoobridge pegmatites are considered analogous to those in the Bynoe pegmatite district and complementary to Core's lithium portfolio. Core will be the first company to explore and drill these prospective, potentially lithium-rich pegmatite systems for lithium mineralisation. Core acquired the Shoobridge Lithium Project in April 2022.

Location: Northern Territory • **Ownership:** 100% CXO • **Commodity:** Lithium

Anningie and Barrow Creek encompass eight exploration licences over approximately 2,000km² in and around the Anningie and Barrow Creek tin-tantalum pegmatite fields in the Northern Territory. The pegmatite fields, which are yet to be drill tested, are considered highly prospective for lithium.

In 2023, Core completed reconnaissance exploration which confirmed lithium potential. Stakeholder engagement is planned to recommence with regional soil and geophysical programs.

Yerelina and Mt Freeling Projects

Location: South Australia • **Ownership:** 100% CXO • **Commodity:** Lithium

The Yerelina and Mt Freeling Projects, located in South Australia, have the potential for large stratiform base metal deposits in conjunction with the identified calcareous and reef limestone. Historically high-grade silver-lead zinc mineralisation has been mined, however little modern exploration has occurred.

Blueys-Inkheart Project

Location: Northern Territory • **Ownership:** 100% CXO • **Commodity:** Lithium

Near surface lead-silver mineralisation is known to the site, with the potential for further mineralisation over a larger area within the Bitter Springs formation.
