Drilling Commences at Copper Hills

Green & Gold Minerals is pleased to announce drilling has commenced at Copper Hills following up the successful initial drilling program at the Herberton Conductor Metals Project. The current program will initially comprise one RC hole and two RC pre-collars for planned diamond tails.

The drilling is designed to test the depth extent and continuity of the high-grade mineralisation identified in GG1's recent drilling at the Copper Hills Main Lode and validate historic assay results.

Following completion of the RC component at Copper Hills, drilling is scheduled to move to Elizabeth Bluffs, where two RC holes are planned at the Elizabeth Mine area. The program will test the mineralised system below the historical workings.

A diamond rig is then scheduled to return to Copper Hills to complete the diamond tails. With the wet season approaching, exploration plans are subject to weather.
