BLAZE Minerals Limited
ASX: BLZ

ASX ANNOUNCEMENT
2 SEPTEMBER 2025

Ntungamo Drilling Results

Blaze Minerals Limited (ASX: BLZ) ("**Blaze**" or the "**Company**") is pleased to provide an update on its Ntungamo Project in Uganda, where it is exploring for critical metals within LCT-type pegmatites and associated granitoids. A total of five (5) diamond drill holes, targeting two pegmatite bodies, was completed in the June quarter for a total of 1,548 meters.

Assay results for holes NT-DD-001 to NT-DD-003 were reported in an ASX release on 11 June 2025 and confirmed a new critical mineral discovery for Gallium and Rubidium.

Final laboratory results have now been received for holes NT-DD-004 and NT-DD-005 and are the highest-grade results to date.

HIGHLIGHTS:

- **Results from holes NT-DD-004 and NT-DD-005 have returned multiple high-grade intercepts over significant widths**
-
- **Highlights include:**
  - **12m @ 33ppm Ga_2O_3 and 494ppm Rb_2O from 165m (NT-DD-004)**
  - **13m @ 27ppm Ga_2O_3 and 441ppm Rb_2O from 226m in (NT-DD-004)**
  - **18m @ 24ppm Ga_2O_3 and 463ppm Rb_2O from 307m in (NT-DD-004)**
  - **17m @ 25ppm Ga_2O_3 and 498ppm Rb_2O from 140m, including 1m @ 934ppm Rb_2O in (NT-DD-005)**

- **Gallium is primarily used in the production of semiconductors, particularly in devices such as light-emitting diodes (LED's) and solar panels**

Results from the lab were reported as element grades. Oxide values were calculated using the following ratios: Ga_2O_3 = Ga x 1.345; Rb_2O = Rb x 1.1; and Sc_2O_3 = Sc x 1.534.

Commenting on the results Managing Director Mathew Walker stated *"We are delighted with these exceptional final results which demonstrate multiple high-grade zones throughout the second pegmatite body from our maiden drilling program. Coupled with our earlier results from the first pegmatite body, these results confirm a new critical mineral discovery for Gallium and Rubidium and the robust potential of the Ntungamo project. Results will be further reviewed and a decision made on the next phase of exploration activity"*

NTUNGAMO PROJECT

The geology of the Ntungamo Project is comprised of a series of metasediments which form part of the Mesoproterozoic Kibaran Belt. These metasediments have been intruded by late-stage LCT pegmatites and associated granitoids which are enriched with several critical metals including gallium, scandium and rubidium. A total of five (5) diamond drill holes, targeting two pegmatite bodies, were completed during the Ntungamo drilling campaign for a total of 1,548 meters. The main rock types intersected were quartz granitoid (QGD), phyllite (GPH), quartz-dominant pegmatite (QPEG), large-grained coarse pegmatite (CPEG), and a slightly crystalline mudstone (SMD) sequence. Gallium was present in all rock types, while rubidium had the highest average grade within the CPEG.

DRILLHOLE SUMMARY TABLE

HOLE ID	LATITUDE	LONGITUDE	ELEVATION	AZIMUTH	INCL.	E.O.H
NT-DD-001	-0.9253238	30.33555	1453 m	120°	60°	387 m
NT-DD-002	-0.9267972	30.33533	1455 m	120°	60°	228 m
NT-DD-003	-0.926826	30.33546	1457 m	300°	60°	264 m
NT-DD-004	-0.9193616	30.33294	1444 m	30°	60°	369 m
NT-DD-005	-0.91934	30.33296	1471 m	30°	60°	300 m

Competent Persons Statement

The information in this announcement that relates to exploration results is based on and fairly represents information and supporting documentation prepared by Mr Dylan le Roux. Mr Dylan le Roux is a consultant geologist for the Company and a member of the South African Council for Natural Scientific Professions ("SACNASP"). Mr Dylan le Roux has a minority shareholding in Gecko Minerals Uganda Limited, the legal and beneficial owner of the Uganda Projects. Mr Dylan le Roux has sufficient experience relevant to the styles of mineralisation and types of deposits which are covered in this announcement and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2012 edition of the 'Australasian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves' ("JORC Code"). Mr Dylan le Roux consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

This announcement has been authorised for release by the Board of Blaze Minerals Limited.

Mathew Walker
Managing Director

Blaze Minerals Limited

- ENDS –

About Blaze Minerals

Blaze Minerals is a mineral exploration company focussed on identifying and developing high-margin, high-grade, and high-value ore deposits in highly prospective regions.

The Company has a highly prospective base metals project in the Republic of the Congo:

- **Loulombo Project, the Republic of the Congo:** The Loulombo Project comprises a total of 195 square kilometres over two granted exploration licenses located 150 kilometres west of Brazzaville, inclusive of the Mimpala Target, a potentially high-grade discovery which has reported exceptional results from preliminary field activities.

The Company has two projects in Uganda:

- **Ntungamo Project, Uganda:** The Ntungamo Project is adjacent to the Mwirasandu Mine, the largest producing tin mine in Uganda, and highly prospective for critical minerals such as gallium and rubidium.
- **Mityana Project, Uganda:** The Mityana Project is the site of a historic open-cut tantalite mine.

JORC Code, 2012 Edition – Table 1 report template

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• This maiden drilling programme targeted 2 pegmatites on the Ntungamo Project, namely the northern and southern pegmatites. • Drilling was designed to intersect the pegmatites at roughly perpendicular angles to test the geometry and mineralisation of the pegmatites at depth. • 5 holes totaling 1548m was drilled. Holes ranged in depth from 228m to 387m. • After recovering core from the rig and logging meter marks, all geological features such as lithology, mineralisation, and alteration are logged by company geologists. Core is then sampled as outlined under "sub-sampling techniques" below.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• A third party contractor conducted diamond drilling using a CS-14 rig. • Standard drilling procedures are followed. • Drilling typically starts with HQ sized core and is cased off to NQ sized core once fresh rock is encountered at approximately 50m depth. • Core is not orientated. •
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• Company geologist logged geotechnical aspects of the core such as recovery and RQD. • Core recovery for the upper 50m is generally poor with an average of 50% due to weathering of the rock. • At depths greater than 50m, recovery and RQD typically exceeded 95%. • No observed relationship between core loss and grades.

Criteria	JORC Code explanation	Commentary
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• Standard core logging procedures were followed. • All core is logged by company geologists including the following aspects: geotechnical logging, lithology, alteration, mineralization, veining and samples. • These aspects are logged with regards to their depth, type and intensity according to standard operating procedures. • Core is photographed wet and dry after all markups have been made, digitally renamed, and uploaded onto an online database.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• After core has been logged geologically, sample intervals are marked on the core. • Sampling is done according to geology on a nominal meter-for-meter basis within the coarse pegmatite (CPEG). Within the host rock such as phyllite or quartz granitoid, a 1m sample is taken every 5m to ensure adequate representation. • Once the sample intervals have been marked, the core is cut in half by an experienced technician. Company geologists then pack the half-core samples into sample bags that have been appropriately labelled and seal the sample bags. • Basic information is captured in a physical “ticket-book” nothing holeID, depth from, depth to, and rock type for each sample. This information is also added to a spreadsheet which is backed up online. • Half core sample size is considered appropriate for a maiden drilling campaign.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• All samples were submitted to ALS Laboratories in Johannesburg, South Africa which is an accredited laboratory. • Samples were assayed by multi-element analysis – ME-MS61 method. • QA/QC samples were inserted at intervals of 1 in 10. These include CRM’s (certified reference materials) – 1 in 30, blanks – 1 in 30, and duplicates – 1 in 30. • CRM’s included AMIS0524 Li 0.73% Ta 5.0 ppm Pegmatite ZA, AMIS0565 Li 0.54% Ta 46ppm Pegmatite Rubicon NA, and AMIS0851 Li 2.73% Sn 387ppm Ta 529ppm Pegmatite AU. • Blanks were blank silica powder (AMIS0865). • QAQC samples returned adequate levels of accuracy.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.*	• Company geological personnel were involved in the collection and interpretation of results. • All primary data is captured in the field and stored in a series of excel spreadsheets which

Criteria	JORC Code explanation	Commentary
	• *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	are backed up online using Microsoft OneDrive. • No independent verification at this stage. • No twin holes at this stage.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• Drillhole collars were positioned (+/- 5m) in WGS 84. • Locations were located by hand held GPS. • Downhole from and to depths are measured by company geologists.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• This is a maiden drilling campaign and drillholes were spaced between 150m and 400m apart. • This is considered appropriate for a first-pass drilling campaign. Drilling was designed to test mineralization and pegmatite geometry at depth. Infill drilling will be required to establish a mineral resource. • No Mineral resources or Ore Reserves are being reported in this release. • No compositing was conducted.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• The underlying structure of the pegmatite is not yet fully understood. However, efforts were made to drill as close to perpendicular to the structure as possible. • True width cannot yet be established. • Geological mapping has indicated that the pegmatites are sub-vertically orientated. Holes were drilled at an inclination of 60 degrees - therefore the drillholes do not intersect mineralization at a completely perpendicular angle. • This is not assumed to have introduced any significant bias at this stage. • "Total intercepted pegmatite width" referred to in this announcement refers to the combined measured lengths of all coarse pegmatite (CPEG) intersections throughout the entire drillhole length. This does not refer to a single pegmatite width and cannot be assumed to be a true width. •
Sample security	• *The measures taken to ensure sample security.*	• Core is stored safely on site. • Once the samples have been cut and bagged, they are transported to the DGSM (mines department) for inspection by DGSM officials. Following receipt of an export permit, the samples are transported to Entebbe Airport by Company personnel and delivered to an air-freight contractor to send the samples directly to ALS Laboratories in Johannesburg. • Samples remain sealed at all times during this

Criteria	JORC Code explanation	Commentary
		process and inspection is merely visual. Samples are opened for the first time at the laboratory.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• No audits or reviews conducted at this stage

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• All drilling was done on EL00301, EL00311 and EL00252 which are granted in terms of the Ugandan mining act. • There are no known impediments to operating on this license. • Blaze is the 60% holder of Gecko Minerals Uganda which owns these licenses.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• Sampling and other activities were conducted by contractors employed by Blaze Minerals Limited.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The prospect is considered to be an LCT-type pegmatite which is prospective for critical metals and REE's such as rubidium, lithium, neodymium, praseodymium and cesium.

Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:*
	  ○ *easting and northing of the drill hole collar*
	  ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar*
	  ○ *dip and azimuth of the hole*
	  ○ *down hole length and interception depth*
	  ○ *hole length.*
	• *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*
		• See the "Drillhole Summary Table" in the body of this announcement.

Data	• *In reporting Exploration Results,*	• Intercepts were calculated for sections of core

Criteria	JORC Code explanation	Commentary
aggregation methods	*weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	where continuous sampling took place (typically within the CPEG lithology). • No upper or lower cut-off was applied. • Grade and length were rounded off to the nearest full number to simplify the reported intercepts. This rounding off is not deemed to have caused any material changes.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Geometry of the pegmatites are not yet known therefore none of the intercepts can be considered true width.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• All diagrams are designed to provide the reader with an accurate and comprehensive overview of the samples locations and grades obtained. • Sectional views show simplified geology and are for illustrative purposes only.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Intercepts were calculated across the entire length of the continuously sampled core. • The full set of results is also available in the Appendix.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• No meaningful previous exploration data to be reported. • Surface sampling has been released in previous announcements.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the*	• The Company will continue to review these results and then make a decision about the next stage of work.

Criteria	JORC Code explanation	Commentary
	main geological interpretations and future drilling areas, provided this information is not commercially sensitive.
