

## CLIMATE CHANGE POSITION STATEMENT

Climate change is a major global issue that presents a momentous challenge to individuals, communities, businesses, industry, governments and the environment. Hillgrove Resources acknowledges the potential impact of broader changes to the environment and climate on our business, the resources sector, our customers and the communities in which we operate.

As a growing Australian copper miner, we are committed to supporting the transition to a low-carbon economy by prioritising initiatives that reduce GHG emissions and have a viable business case.

Copper is a critical material for renewable energy technologies, electrification, and energy efficiency. Our role in responsibly supplying copper has a direct impact on enabling the global shift to cleaner energy.

As a business, we seek to understand and manage climate change impacts on our current and future operations, which reduces greenhouse gas emissions within our operations and across our value chain. This will ultimately support both a reduction in climate change impacts and long-term returns for our shareholders.

We undertake to build climate resilience into our business by factoring climate risks into our existing risk management profile. At the same time, we are working towards the creation of resilient mining landforms and revegetation programs that consider the changing climate.

We understand that mining operations are energy-intensive, and our sector has a responsibility to minimise environmental impact while supporting the development of resources critical to a sustainable future. Through our actions, we aim to not only reduce our carbon footprint but also to play a role in enabling the global transition to a sustainable, low-carbon economy.
