12 January 2026

Liontown Drilling Extended After High-Grade Au and Ag Results

Highlights

- RC results received from a further 30 holes at Liontown, with exceptional silver and gold intercepted near surface. Best intercepts include:
 - **4m @ 17.65g/t Au & 402g/t Ag** from 25m (25LTRC035), including 1m @ 23.2g/t Au from 27m of stope fill
 - **8m @ 6.16g/t Au & 37g/t Ag** from 3m (25LTRC033)
 - **4m @ 9.49g/t Au & 128g/t Ag** from 20m (25LTRC032)
 - **5m @ 6.92g/t Au & 77g/t Ag** from 16m (25LTRC037)
 - **2m @ 16.75g/t Au & 52g/t Ag** from 17m (25LTRC034), including **1m @ 23.2g/t Au** from 27m of stope fill
- Total of 68 holes (2,657m) of an 84-hole (3,333m) RC grade control drilling program have now been completed, primarily at the eastern end of the Liontown oxide Resource.
- The Liontown Resource currently contains **5.5 Moz of silver at 27.1g/t Ag**, with the Liontown Mining Study considering **803Koz Ag at 31.6g/t Ag**.
- RC drilling has returned the highest silver grades recorded to date at Liontown, including:
 - **5m @ 0.86g/t Au & 1,870g/t Ag** from 33m (25LTRC058)
 - **8m @ 7.31g/t Au & 1,321g/t Ag** from 10m (25LTRC052) including **3m @ 6.78g/t Au & 2,410g/t Ag** from 13m
 - **2m @ 7.65g/t Au & 1,198g/t Ag** from 39m (25LTRC057)
- Drilling has recommenced and the program has increased by ~37 additional holes (1,890m) to further test high-grade mineralisation, with the resource remaining open to the east.

Sunshine Metals Limited (ASX:SHN, “Sunshine”) has received high-grade gold and silver near-surface results from grade control drilling at Liontown, part of the Ravenswood Consolidated Project in North Queensland. Latest results are from the eastern end of the shallow oxide gold resource and prompted an immediate expansion of the drilling program.

Sunshine Managing Director Dr Damien Keys commented “Liontown continues to demonstrate the strength of its underlying mineral endowment, with recent drilling confirming that silver is emerging as a meaningful value driver alongside gold. The scale, grade and shallow nature of the gold-silver mineralisation provide Sunshine with a compelling development opportunity at a time when silver markets are increasingly focused on security of supply.

Our Gold Mining Study is progressing well and remains on schedule for delivery in January 2026. With the gold-to-silver ratio fluctuating between 60-80:1, we are also refining the Study to incorporate the high-grade silver zones. We remain on track to become a gold and silver producer in 2026.”

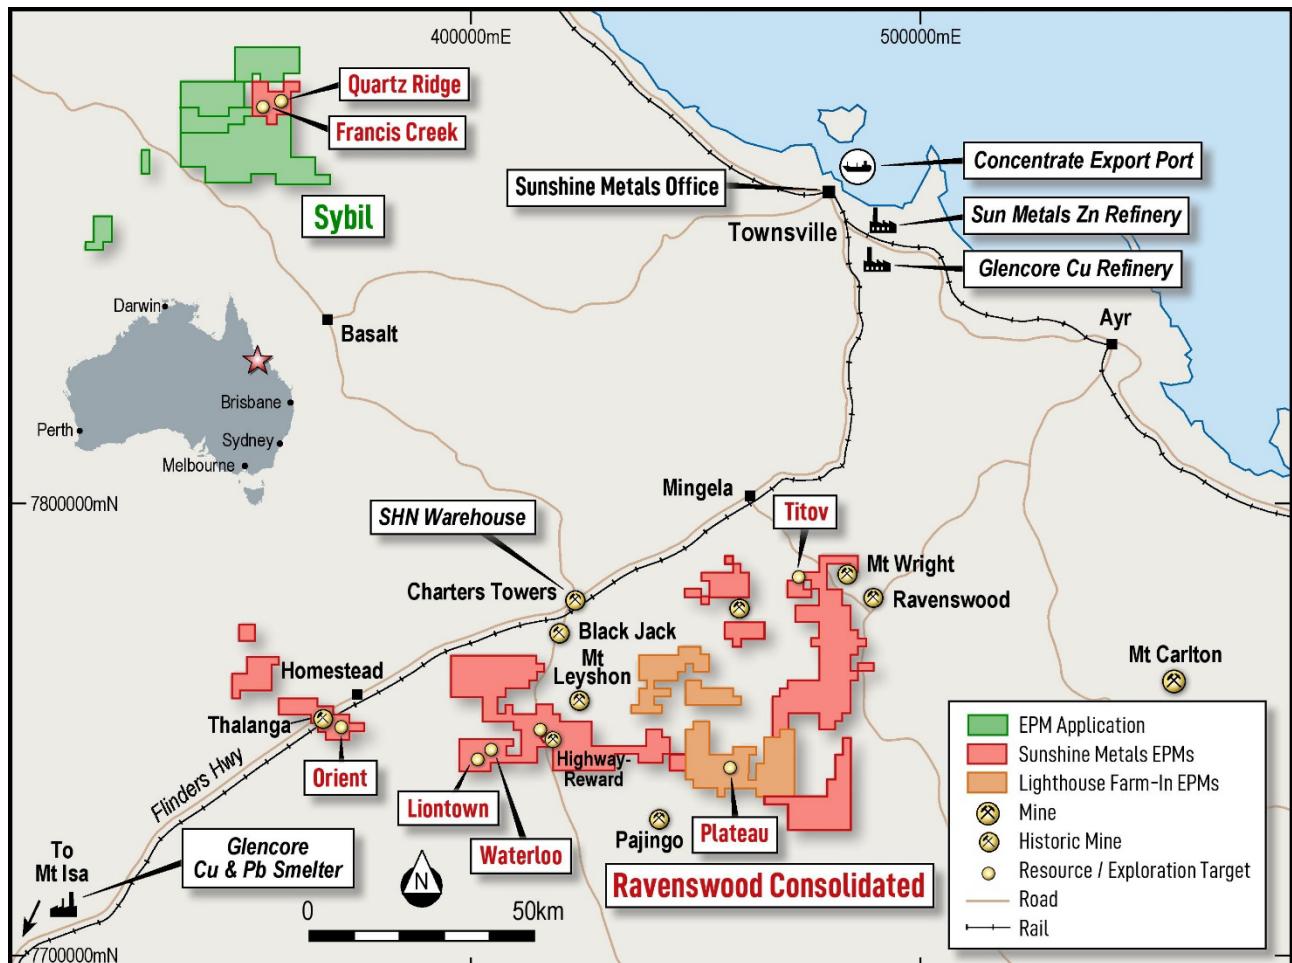

Figure 1: Shallow oxide gold prospects at Ravenswood and proximity to established mines, infrastructure and the mining hub of Charters Towers in Queensland.

Liontown Grade Control Drilling Program

RC grade control drilling commenced in November 2025 on the Shallow Au Resource at Liontown (Figures 3 and 4). The program comprises 84 holes for a total of 3,333m and is designed to achieve drill spacing of ~12.5m x 12.5m in areas amenable to open pit mining. This spacing is expected to further improve mine planning and support potential toll treatment discussions.

Drilling completed to date totals 68 holes (2,657m) primarily at the eastern end of the Shallow Au Resource. Following a scheduled break over the Christmas period, drilling has recommenced and has been immediately extended by a further 37 holes (1,890m) after receiving shallow high-grade gold and silver results. The Shallow Au Resource remains open to the east.

Further results from the ongoing drilling program are expected to be received and reported throughout January and February 2026.

Figure 2: RC grade control rig setting up at Liontown.

Liontown Gold Mining Study

The Liontown mineral system is strongly zoned, allowing the Gold Mining Study to focus on gold-only and gold-dominant mineralisation, which represents ~13% of the total Liontown Resource tonnes. Consideration is now being given to modifying the Study to include the high-grade silver zones intersected by recent drilling, with future studies expected to encompass the remainder of the deposit.

Liontown was historically mined as the Carrington Gold Mine, from which 28Koz Au @ 22g/t Au was produced between 1905 to 1911. The Carrington lode and its strike extensions, including the Au Panel, are included in the current Gold Mining Study.

The Liontown Gold Mining Study, which is currently in progress, will consider **0.8Mt @ 4.3g/t Au for 108Koz Au & 31.6g/t Ag for 803Koz Ag.**

This is comprised of the zones outlined in the following table:

Resource Zone	Resource Classification	Cut-off Applied	Tonnes (,000)	Au Grade (g/t)	Contained Au Oz (,000)	Ag Grade (g/t)	Contained Ag Oz (,000)
Shallow Au	Indicated	0.75g/t Au	240	2.53	19.5	40.5	312.5
Shallow Au	Inferred	0.75g/t Au	65	1.76	3.7	19.3	40.1
Carrington Fresh	Indicated	2.0g/t Au	208	3.21	21.5	52.7	352.8
Carrington Fresh	Inferred	2.0g/t Au	31	5.52	5.4	10.9	10.7
Au Panel Fresh	Indicated	2.0g/t Au	149	8.23	39.4	9.0	43.1
Au Panel Fresh	Inferred	2.0g/t Au	98	5.99	18.8	14.1	44.3
TOTAL			790	4.27	108.3	31.6	803.6

Table 1: Liontown Gold Mining Study Resource areas and model cut-off grade assumptions. Drilling has been completed, & metallurgy is underway to convert Inferred to Indicated Resource in the Shallow Au domain

Liontown Gold Mining Study – Mineralisation Zones

See Figure 3 for Long Section of Mineralisation Zones

Shallow Gold

The oxide/transitional Resource under consideration is **23.2Koz Au & 352Koz Ag** (305Kt @ 2.37g/t Au & 36.0g/t Ag). This represents a **22%** increase in tonnes, a **16%** increase in grade and a **41%** increase in contained gold ounces.

Historical mined voids (~1-2m wide true thickness) were intersected in predicted locations in the drill program (ASX 10 Jun 2025) and were incorporated into updated void and geology models.

Carrington Fresh

Carrington Fresh is located below the base of oxidation at the oxide/transitional Resource referred to above. This Resource contains **26.9Koz Au & 364Koz Ag** (238Kt @ 3.51g/t Au & 47.4g/t Ag). This represents a **7% increase** in tonnes, a **13% increase** in grade and a **14% increase** in contained gold ounces. The Resource is extensional to historic mining.

Gold Panel (Indicated & Inferred)

The Au Panel is located ~200m east of the Shallow Au and comprises **58.2Koz Au & 87Koz Ag (247Kt @ 7.35g/t Au & 11.0g/t Ag)**. The high-grade Resource is comprised of:

- **149Kt @ 8.23g/t Au (& 9.0g/t Ag) 39Koz Au & 43Koz Ag** in Indicated
- **98Kt @ 5.99g/t Au (& 14.1g/t Ag) 19Koz Au & 44Koz Ag** in Inferred

Previous metallurgical test work from the Au Panel (ASX 11 Nov 2024), considered indicative of the Au-Panel and Carrington Fresh, displayed rapid leach kinetics, with >90% of gold recovered in two hours using standard lime and cyanide consumptions. The test work returned 48-hour leach extractions of 99.4% and 98.4% (at 38µm grind size) and 97.4% and 95.0% (at 106µm grind size).

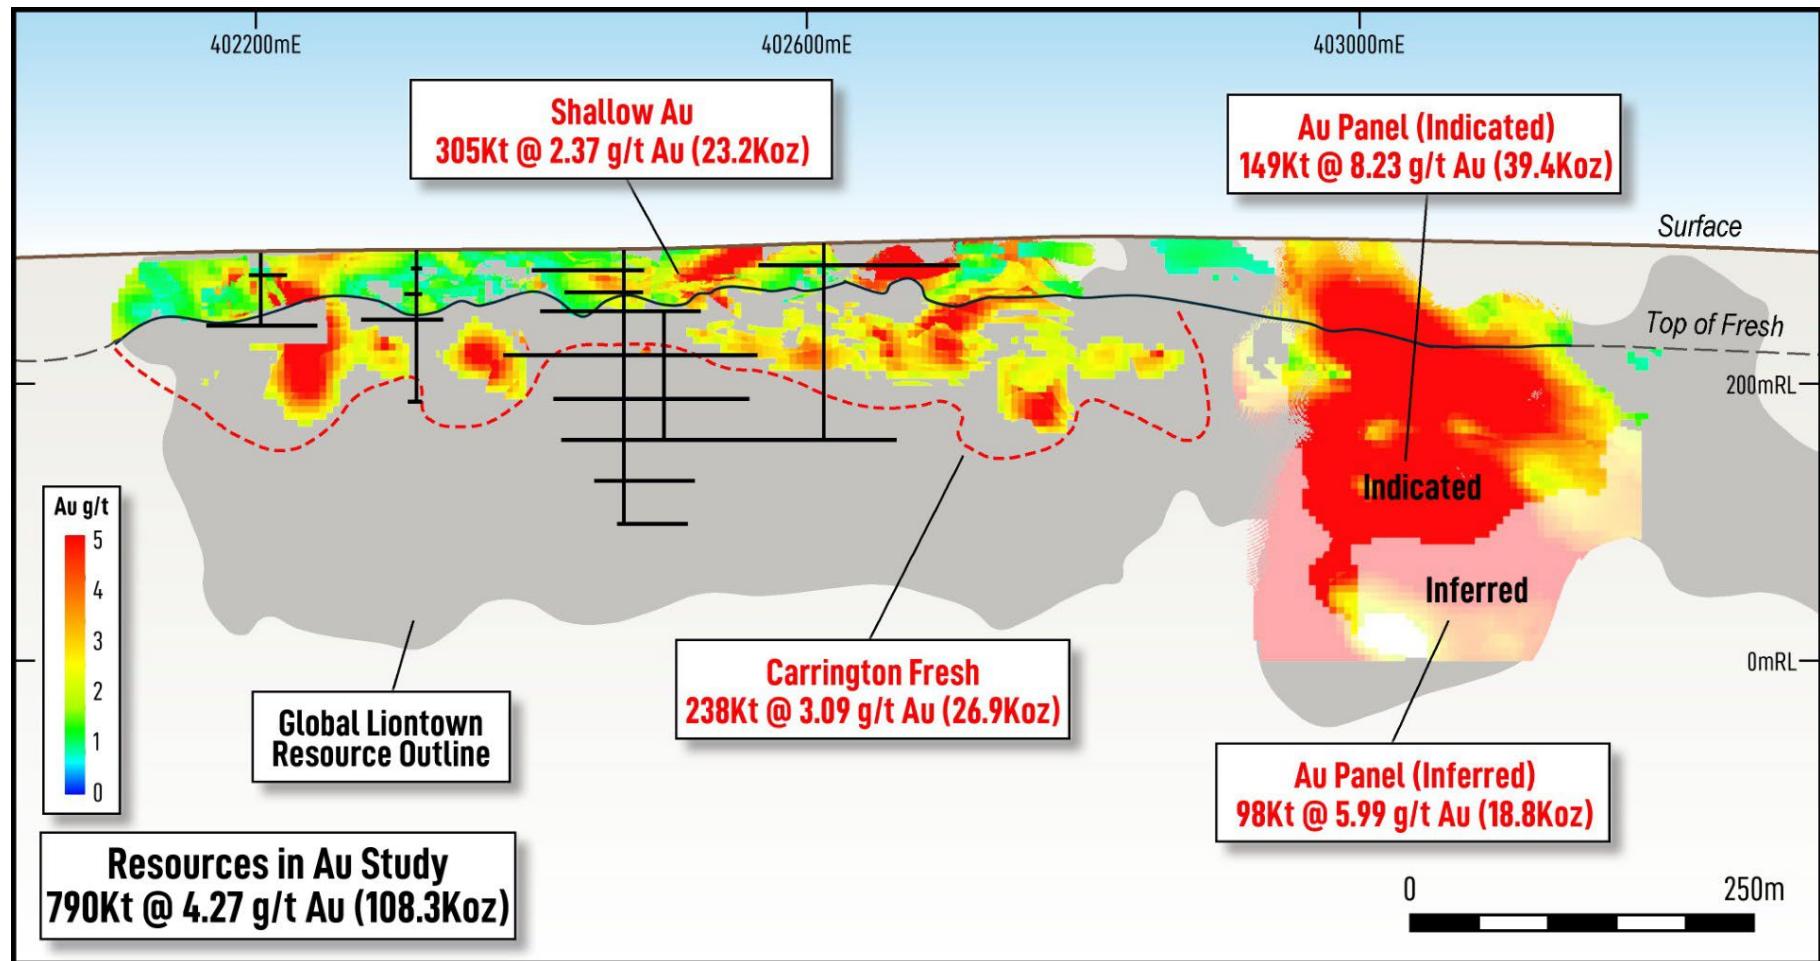

Figure 3: Long section of the Resources under consideration in the Au Study. Block model coloured by gold content showing the Shallow Au above the Carrington Fresh and the high-grade Au Panel. No remnant Resource has been assigned around the historic Carrington workings.

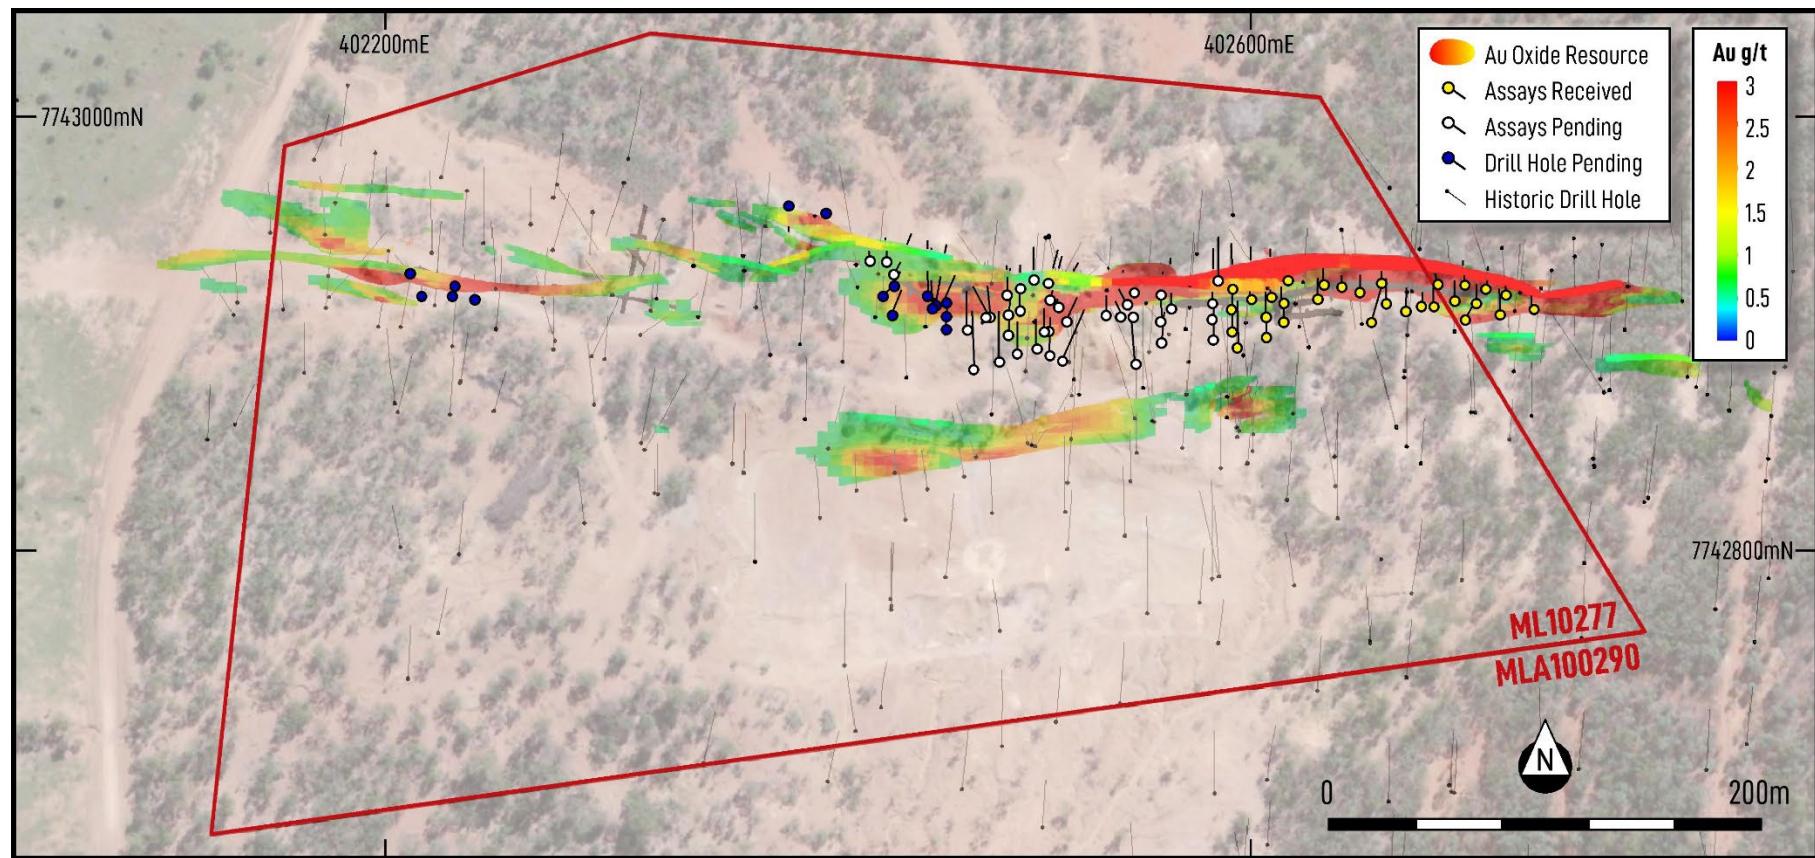

Figure 4: Plan view of Liotown and current drilling program in relation to the oxide Au Resource.

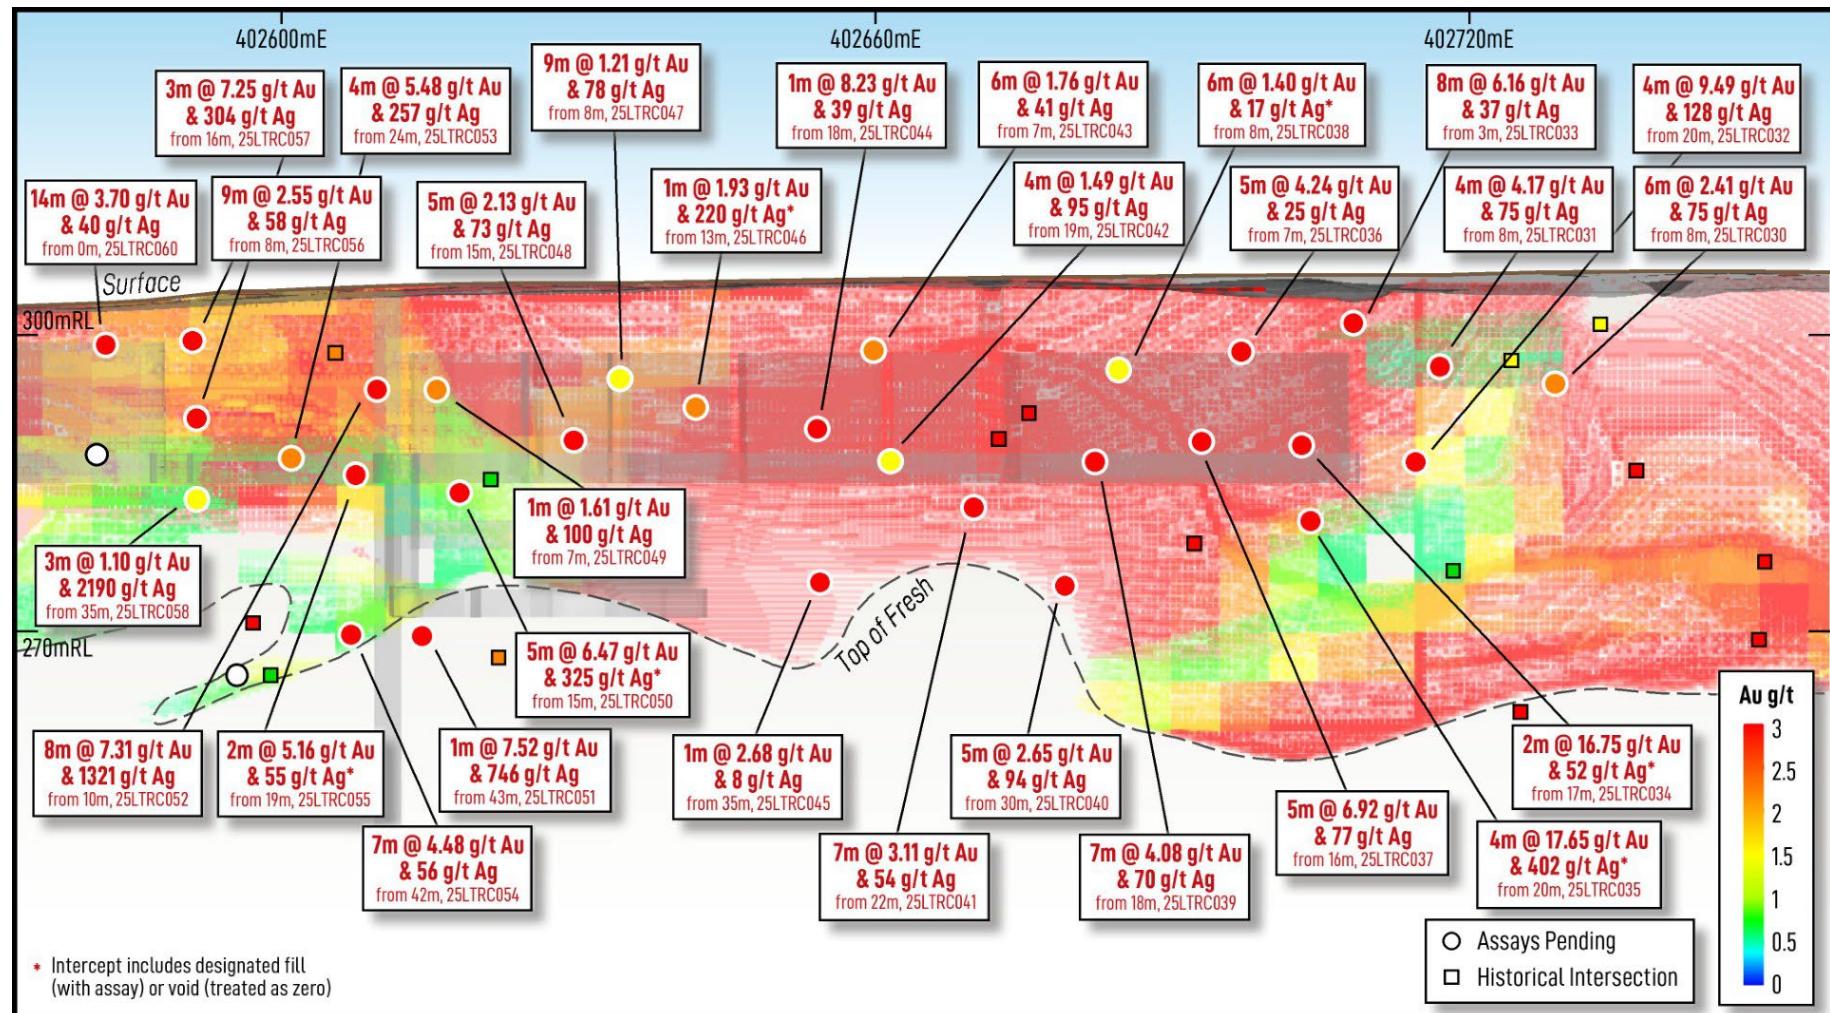

Figure 5: Long section of the eastern end of the drilling program, looking north, showing the location of the drill hole intercepts in relation to the oxide Au Resource.

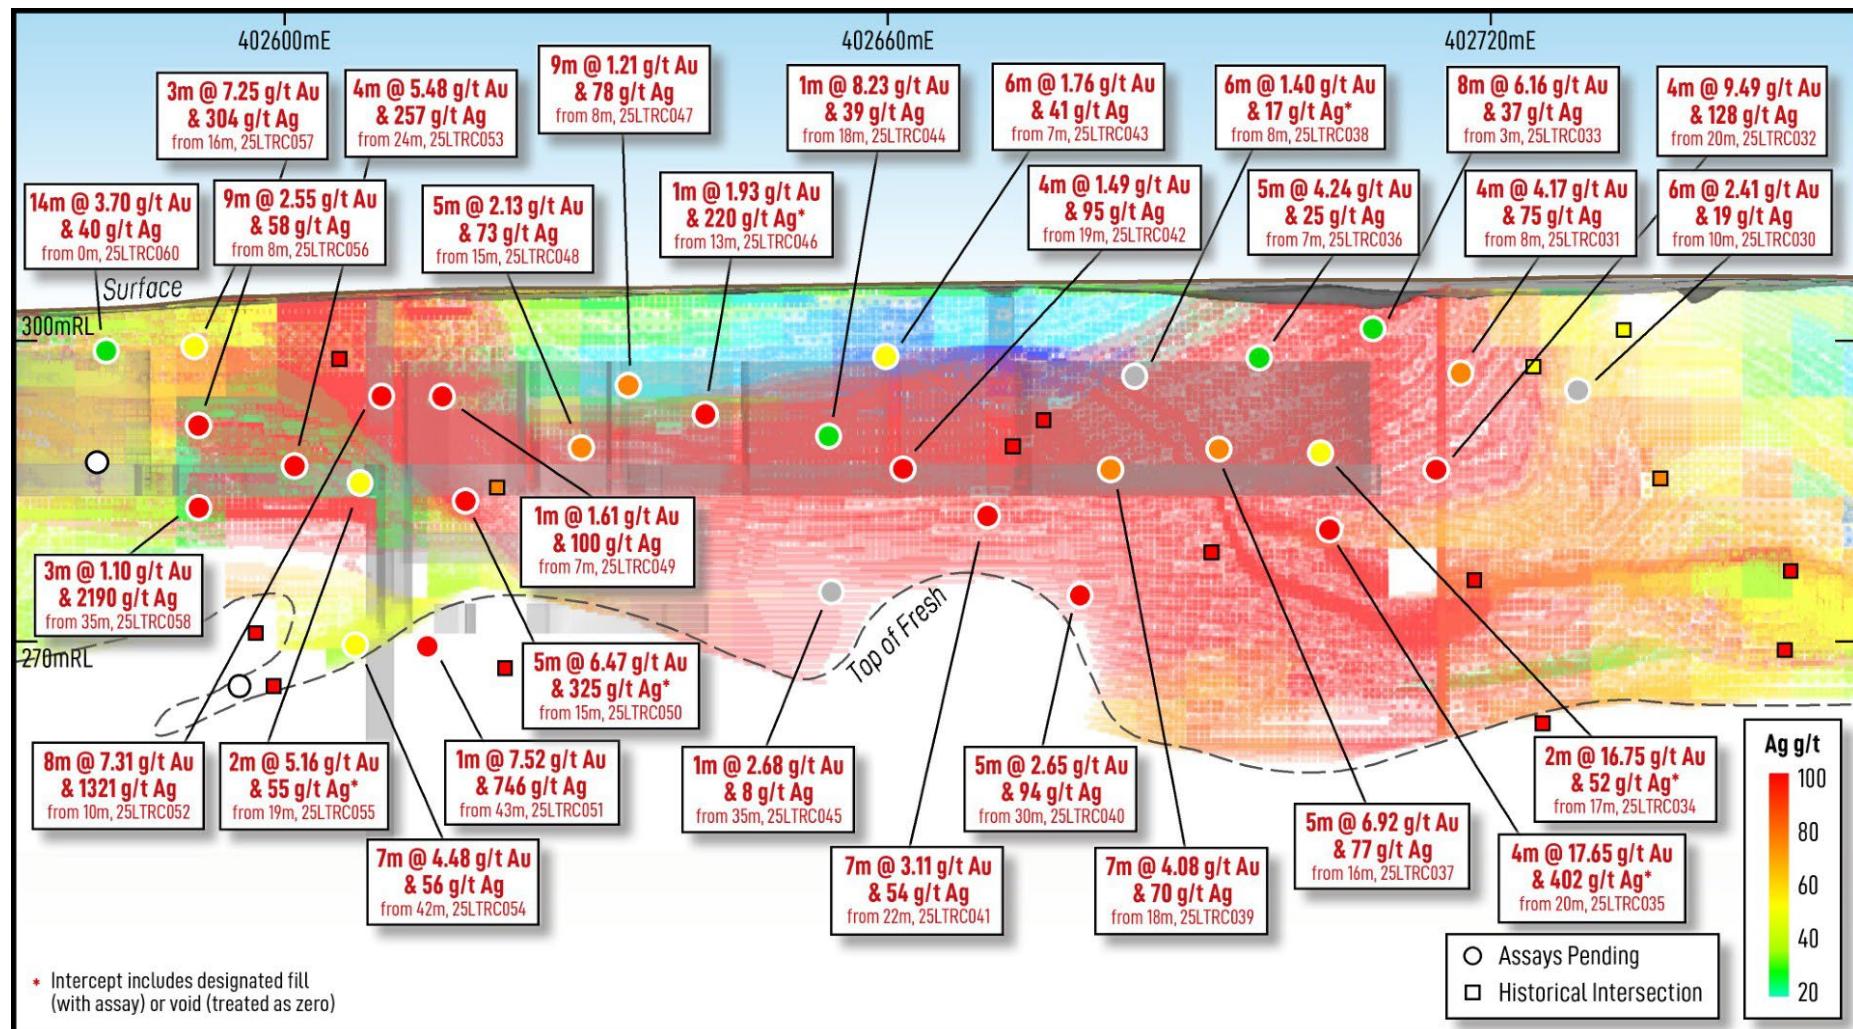

Figure 6: Long section of the eastern end of the drilling program, looking north, showing the location of the drill hole intercepts in relation to the oxide Ag Resource.

Planned activities

The Company has a busy period ahead including the following key activities and milestones:

- Jan 2026: Gold Mining Study at Liotontown
- Jan - Feb 2026: Liotontown grade control drilling results
- Q1 2026: Sybil magnetic survey commences

Sunshine's Board has authorised the release of this announcement to the market.

Competent Person's Statement

The information in this report that relates to Exploration Results is based on, and fairly represents, information compiled by Mr Matt Price, a Competent Person who is a Member of the Australian Institute of Geoscientists (AIG) and the Australian Institute of Mining and Metallurgy (AusIMM). Mr Price has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration, and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the JORC Code. Mr Price consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The information in this report that relates to Mineral Resources at Liontown is based on information compiled and reviewed by Mr Lyon Barrett who is a Member of the Australian Institute of Mining and Metallurgy (AusIMM) and is a Principal Geologist employed by Measured Group Pty Ltd. Mr Barrett has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Mineral Resources. Mr Barrett consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The information in this report that relates to Mineral Resources at Plateau is based on information compiled and reviewed by Dr Damien Keys, who is a Member of the Australasian Institute of Mining and Metallurgy and a Member of the Australian Institute of Geoscientists (AIG). Dr Keys has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Mineral Resources. Dr Keys consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The information in this report that relates to Mineral Resources at Waterloo and Orient is based on information compiled and reviewed by Mr Stuart Hutchin, who is a Member of the Australian Institute of Geoscientists (AIG) and is a Principal Geologist employed by Mining One Pty Ltd. Mr Stuart Hutchin has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Mineral Resources. Mr Stuart Hutchin consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The information in this report that relates to Mineral Resources at Liontown East is based on information compiled and reviewed by Mr Peter Carolan, who is a Member of the Australasian Institute of Mining and Metallurgy and was a Principal Geologist employed by Red River Resources Ltd. Mr Peter Carolan has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Mineral Resources. Mr Peter Carolan consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

About Sunshine Metals

Big System Potential.

Ravenswood Consolidated Project (Zn-Cu-Pb-Au-Ag-Mo): Located in the Charters Towers-Ravenswood district which has produced over 20Moz Au and 14mt of VMS Zn-Cu-Pb-Au ore. The project comprises:

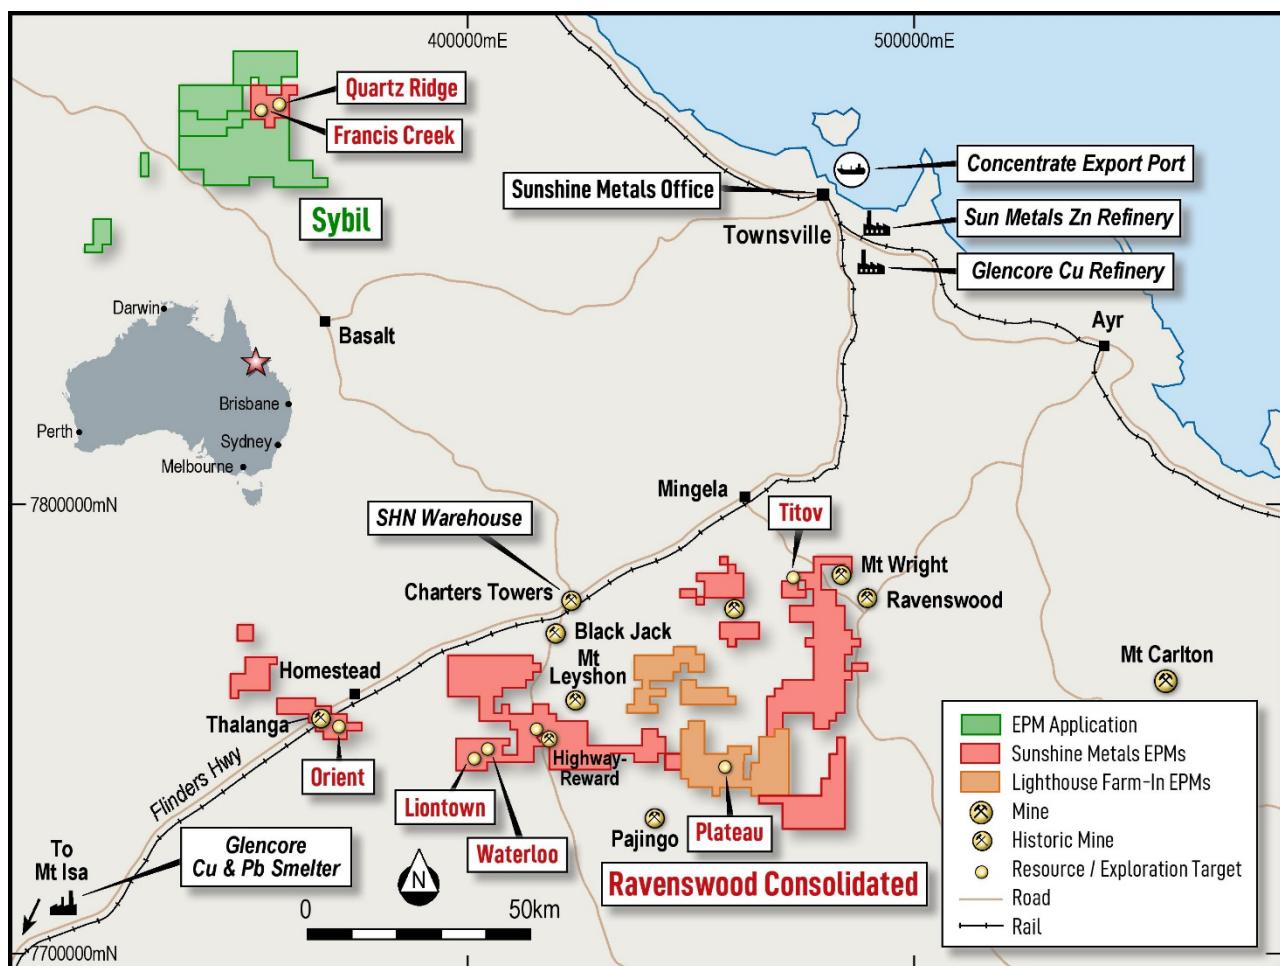

- The newly interpreted Lointown Dome, hosting multiple gold and base metal prospects;
- a Zn-Cu-Pb-Au VMS Resource of 7.4mt @ 3.9g/t Au (929koz AuEq) or 10.9% ZnEq (43% Indicated, 57% Inferred¹);
- the under-drilled Lointown Au-rich footwall with significant intersections including:
 - **20.0m @ 18.2g/t Au** (109m, 24LTRC005)
 - **17.0m @ 22.1g/t Au** (67m, 23LTRC002)
 - **10.0m @ 31.91g/t Au** (41m, 25LTRC009)
 - **8.0m @ 11.7g/t Au & 0.9% Cu** (115m, LLRC184)
 - **8.1m @ 10.7g/t Au** (154m, LTDD22055)
 - **5.0m @ 27.9g/t Au, 1.7% Cu** (20m, LRC018)
- advanced Au-Cu VMS targets at Coronation and Highway East, analogous to the nearby Highway-Reward Mine (3.9mt @ 5.3% Cu & 1.1g/t Au mined);
- recent addition of the Sybil low sulphidation epithermal gold system, located 135km west of Townsville and ~140km north of Charters Towers.
- Sybil is analogous to the nearby Pajingo epithermal system (~4Moz Au produced) and has seen little exploration for the last 20 years.
- Sybil's most advanced prospect, Francis Creek, contains best results including:
 - **4.4m @ 57.51g/t Au** from 23.6m (25FCDD003)
 - **7.0m @ 10.6g/t Au** from 7m (FCP05)
 - **3.0m @ 23.2g/t Au** from 6m (open at end of hole, FCP04)
 - **6.0m @ 10.5g/t Au** from 7m (open at end of hole, FCP46)
 - **6.0m @ 8.4g/t Au** from 5m (FCP17)
- rock chips of **907g/t Au** and **262g/t Au** have been returned from Francis Creek and a bulk sample mined in 1991 produced **961t @ 7.6g/t Au (235oz Au)**.

***Investigator Project** (Cu): Located 100km north of the Mt Isa and is hosted in the same stratigraphy and similar fault architecture as the Capricorn Copper Mine, located 12km to the north.

***Hodgkinson Project** (Au-W): Located between the Palmer River alluvial gold field (1.35 Moz Au) and the historic Hodgkinson gold field (0.3 Moz Au).

* *These projects will be divested in an orderly manner in due course.*

¹ This announcement contains references to exploration results and estimates of mineral resources that were first reported in Sunshine's ASX announcement dated 11 December 2024. Sunshine confirms that it is not aware of any new information or data that materially affects the information included in the relevant market announcement. In relation to estimates of mineral resources, Sunshine confirms that all material assumptions and technical parameters underpinning the estimates in the relevant market announcement continue to apply and have not materially changed. Metal equivalent calculation on next page.

Recoverable Gold & Zinc Equivalent calculations

The gold and zinc equivalent grades for Greater Liontown (g/t AuEq, % ZnEq) are based on the following prices: US\$2,900t Zn, US\$9,500t Cu, US\$2,000t Pb, US\$2,500oz Au, US\$30oz Ag.

Metallurgical metal recoveries are broken into two domains: copper-gold dominant and zinc dominant. Each domain and associated recoveries are supported by metallurgical test work and are: Copper-gold dominant – 92.3% Cu, 86.0% Au, Zinc dominant 88.8% Zn, 80% Cu, 70% Pb, 65% Au, 65% Ag.

The AuEq calculation is as follows: $AuEq = (Zn\ grade\% * Zn\ recovery * (Zn\ price\ $/t * 0.01 / (Au\ price\ $/oz\ / 31.103))) + (Cu\ grade\% * Cu\ recovery\% * (Cu\ price\ $/t / (Au\ price\ $/oz\ / 31.103))) + (Pb\ grade\% * Pb\ recovery\% * (Pb\ price\ $/t / (Au\ price\ $/oz\ / 31.103))) + (Au\ grade\ g/t / 31.103 * Au\ recovery\%) + (Ag\ grade\ g/t / 31.103 * Ag\ recovery\% * ((Ag\ price\ $/oz\ / 31.103 / (Au\ price\ $/oz\ / 31.103)))$

The ZnEq calculation is as follows: $ZnEq = (Zn\ grade\% * Zn\ recovery) + (Cu\ grade\% * Cu\ recovery\% * (Cu\ price\ $/t / Zn\ price\ $/t * 0.01)) + (Pb\ grade\% * Pb\ recovery\% * (Pb\ price\ $/t / Zn\ price\ $/t * 0.01)) + (Au\ grade\ g/t / 31.103 * Au\ recovery\% * ((Au\ price\ $/oz\ / 31.103 / Zn\ price\ $/t * 0.01)) + (Ag\ grade\ g/t / 31.103 * Ag\ recovery\% * ((Ag\ price\ $/oz\ / 31.103 / Zn\ price\ $/t * 0.01))$

For Waterloo transition material, recoveries of 76% Zn, 58% Cu and 0% Pb have been substituted into the ZnEq formula. For Liontown oxide material, recoveries of 44% Zn, 40% Cu and 35% Pb have been substituted into the ZnEq formula. Further metallurgical test work is required on the Liontown oxide domain. It is the opinion of Sunshine and the Competent Person that the metals included in the ZnEq formula have reasonable potential to be recovered and sold.

The Ravenswood Consolidated VMS Resource is comprised of 7.0mt @ 1.3g/t Au, 0.9% Cu, 5.5% Zn, 1.7% Pb and 31g/t Ag (11.1% ZnEq). For further details refer to SHN ASX Release, 11 December 2024, "904koz AuEq Resource at Ravenswood Consolidated".

SHN earning 75% equity in Lighthouse Farm-In tenements. Refer to SHN ASX release, 20 January 2023 "Consolidation of High-Grade Advanced Au Prospects, RW"

The gold and zinc equivalent grades for Greater Liontown (g/t AuEq, % ZnEq) are based on the following prices:

US\$2,900t Zn, US\$9,500t Cu, US\$2,000t Pb, US\$2,500oz Au, US\$300z Ag. Metallurgical metal recoveries are broken into two domains: copper-gold dominant and zinc dominant. Each domain and associated recoveries are supported by metallurgical test work and are: Copper-gold dominant – 92.3% Cu, 86.0% Au, Zinc dominant 88.8% Zn, 80% Cu, 70% Pb, 65% Au, 65% Ag.

The AuEq calculation is as follows: AuEq = (Zn grade% * Zn recovery * (Zn price \$/t * 0.01 / (Au price \$/oz / 31.103))) + (Cu grade% * Cu recovery % * (Cu price \$/t / (Au price \$/oz / 31.103))) + (Pb grade% * Pb recovery % * (Pb price \$/t / (Au price \$/oz / 31.103))) + (Au grade g/t / 31.103 * Au recovery %) + (Ag grade g/t / 31.103 * Ag recovery % * ((Ag price \$/oz / 31.103 / (Au price \$/oz / 31.103)))

The ZnEq calculation is as follows: ZnEq = (Zn grade% * Zn recovery) + (Cu grade% * Cu recovery % * (Cu price \$/t / Zn price \$/t * 0.01)) + (Pb grade% * Pb recovery % * (Pb price \$/t / Zn price \$/t * 0.01)) + (Au grade g/t / 31.103 * Au recovery % * ((Au price \$/oz / 31.103) / Zn price \$/t * 0.01)) + (Ag grade g/t / 31.103 * Ag recovery % * ((Ag price \$/oz / 31.103) / Zn price \$/t * 0.01)).

For Waterloo transition material, recoveries of 76% Zn, 58% Cu and 0% Pb have been substituted into the ZnEq formula. For Liontown oxide material, recoveries of 44% Zn, 40% Cu and 35% Pb have been substituted into the ZnEq formula. Further metallurgical test work is required on the Liontown oxide domain. It is the opinion of Sunshine and the Competent Person that the metals included in the ZnEq formula have reasonable potential to be recovered and sold.

The Ravenswood Consolidated VMS Resource is comprised of 7.36mt @ 1.4g/t Au, 0.9% Cu, 5.2% Zn, 1.6% Pb and 31g/t Ag (10.9% ZnEq).

Section 1 - Sampling Techniques and Data

Criteria	Explanation	Commentary																																																																																																																																																																																																													
Sampling techniques	<p><i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</i></p> <p><i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></p> <p><i>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for Fire Assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i></p>	<ul style="list-style-type: none"> • No new drilling was undertaken at Liotown East, Waterloo or Orient. • Diamond drilling (DD), reverse circulation (RC) and mud rotary (MR) techniques were used to obtain samples during 14 programmes of drilling undertaken between 1970 and 2024 for a total of 530 drill holes and 92,220 metres. The company, year, drilling method, hole count, and metres drilled count is outlined below: <table border="1"> <thead> <tr> <th>Prefix</th><th>Program</th><th>Company</th><th>Hole_Type</th><th>Year</th><th>Meters</th><th>Num. of holes</th></tr> </thead> <tbody> <tr><td>CGD</td><td>0</td><td>Pancontinental</td><td>RC</td><td>1994?</td><td>215</td><td>1</td></tr> <tr><td>LCD</td><td>0</td><td>Esso</td><td>RC</td><td>1982?</td><td>200</td><td>1</td></tr> <tr><td>LCP</td><td>0</td><td>Esso</td><td>RC</td><td>1982?</td><td>210</td><td>2</td></tr> <tr><td>LCR</td><td>0</td><td>Esso</td><td>RAB</td><td>1982?</td><td>993</td><td>31</td></tr> <tr><td>LED</td><td>0</td><td>Esso</td><td>RC</td><td>1982?</td><td>235</td><td>1</td></tr> <tr><td>LEP</td><td>0</td><td>Esso</td><td>PC</td><td>1982?</td><td>110</td><td>1</td></tr> <tr><td>LER</td><td>0</td><td>Esso</td><td>RAB</td><td>1982?</td><td>2,595</td><td>53</td></tr> <tr><td>LSR</td><td>0</td><td>Esso</td><td>RAB</td><td>1982?</td><td>179</td><td>4</td></tr> <tr><td>LTR</td><td>0</td><td>Esso</td><td>RAB</td><td>1982?</td><td>1,161</td><td>54</td></tr> <tr><td>TTD</td><td>0</td><td>Pancontinental</td><td>RC</td><td>1994-1996?</td><td>737</td><td>3</td></tr> <tr><td>NS</td><td>1</td><td>Government</td><td>Unknown</td><td>Unknown</td><td>1,598</td><td>18</td></tr> <tr><td rowspan="4">LLD</td><td>3</td><td>Nickel Mines</td><td>DD</td><td>1970-1973</td><td>7,669</td><td>59</td></tr> <tr><td rowspan="3">4</td><td rowspan="3">Esso</td><td>RC</td><td>1982</td><td>8,252</td><td>27</td></tr> <tr><td>DD</td><td>1994</td><td>834</td><td>4</td></tr> <tr><td>RC</td><td>1994</td><td>1,559</td><td>6</td></tr> <tr><td>LLR</td><td>5</td><td>Esso</td><td>RAB</td><td>1983</td><td>1,536</td><td>37</td></tr> <tr><td rowspan="3">LLRC</td><td rowspan="3">6</td><td>Pancontinental</td><td>RC</td><td>1994-1996</td><td>10,257</td><td>100</td></tr> <tr><td>RGC</td><td>RC</td><td>Unknown</td><td>150</td><td>2</td></tr> <tr><td>Unknown</td><td>RC</td><td>Unknown</td><td>40</td><td>1</td></tr> <tr><td>LLRCD</td><td>6</td><td>Red River Resources</td><td>DD</td><td>2022</td><td>171</td><td>1</td></tr> <tr><td>LRC</td><td>7</td><td>Great Mines</td><td>RC</td><td>Unknown</td><td>3,302</td><td>50</td></tr> <tr><td>LTD</td><td>8</td><td>Liotown Resources</td><td>DD</td><td>Unknown</td><td>13,439</td><td>41</td></tr> <tr><td>LTDD18</td><td>8</td><td>Red River Resources</td><td>DD</td><td>2018</td><td>4,935</td><td>10</td></tr> <tr><td>LTDD19</td><td>8</td><td>Red River Resources</td><td>DD</td><td>2019</td><td>5,281</td><td>34</td></tr> <tr><td rowspan="3">LTDD21</td><td rowspan="3">8</td><td rowspan="3">Red River Resources</td><td rowspan="3">DD</td><td>2021</td><td>3,446</td><td>12</td></tr> <tr><td>2022</td><td>667</td><td>2</td></tr> <tr><td>Unknown</td><td>396</td><td>1</td></tr> <tr><td>LTDD22</td><td>8</td><td>Red River Resources</td><td>DD</td><td>2022</td><td>8,305</td><td>37</td></tr> <tr><td rowspan="2">LTCD18</td><td rowspan="2">9</td><td rowspan="2">Red River Resources</td><td>MRRC</td><td>2018</td><td>1,620</td><td>5</td></tr> <tr><td>MRRCD</td><td>2018</td><td>737</td><td>2</td></tr> <tr><td rowspan="2">LTED</td><td rowspan="2">10</td><td rowspan="2">Red River Resources</td><td rowspan="2">DD</td><td>2017</td><td>3,410</td><td>6</td></tr> <tr><td>2018</td><td>2,316</td><td>5</td></tr> </tbody> </table>	Prefix	Program	Company	Hole_Type	Year	Meters	Num. of holes	CGD	0	Pancontinental	RC	1994?	215	1	LCD	0	Esso	RC	1982?	200	1	LCP	0	Esso	RC	1982?	210	2	LCR	0	Esso	RAB	1982?	993	31	LED	0	Esso	RC	1982?	235	1	LEP	0	Esso	PC	1982?	110	1	LER	0	Esso	RAB	1982?	2,595	53	LSR	0	Esso	RAB	1982?	179	4	LTR	0	Esso	RAB	1982?	1,161	54	TTD	0	Pancontinental	RC	1994-1996?	737	3	NS	1	Government	Unknown	Unknown	1,598	18	LLD	3	Nickel Mines	DD	1970-1973	7,669	59	4	Esso	RC	1982	8,252	27	DD	1994	834	4	RC	1994	1,559	6	LLR	5	Esso	RAB	1983	1,536	37	LLRC	6	Pancontinental	RC	1994-1996	10,257	100	RGC	RC	Unknown	150	2	Unknown	RC	Unknown	40	1	LLRCD	6	Red River Resources	DD	2022	171	1	LRC	7	Great Mines	RC	Unknown	3,302	50	LTD	8	Liotown Resources	DD	Unknown	13,439	41	LTDD18	8	Red River Resources	DD	2018	4,935	10	LTDD19	8	Red River Resources	DD	2019	5,281	34	LTDD21	8	Red River Resources	DD	2021	3,446	12	2022	667	2	Unknown	396	1	LTDD22	8	Red River Resources	DD	2022	8,305	37	LTCD18	9	Red River Resources	MRRC	2018	1,620	5	MRRCD	2018	737	2	LTED	10	Red River Resources	DD	2017	3,410	6	2018	2,316	5

Historic								
<ul style="list-style-type: none"> Industry standard preparation and analysis methods were used. RC samples were typically collected in 1m intervals with all samples sent for assay. Diamond core was reviewed with specific zones selected for assay by the Geologist. These zones were then sawn longitudinally in half, with the half core sample sent for analysis. Core sizes ranged from NQ to HQ. The majority of the samples were analysed following a three- or four- acid digest and either via Atomic Absorption Spectrum (AAS) or Inductively Coupled Plasma Optical Emission Spectrometry (ICP-OES) for the analysis of base metals. Gold was analysed via Fire Assay using either 25g, 30g or 50g charge with an AAS finish. 								
RVR								
<ul style="list-style-type: none"> Industry standard preparation and analysis methods were used. Reverse circulation drill holes were sampled as individual 1m length samples derived through a rig-mounted cone splitter to create a 12.5% split weighing approximately 3 to 5kgs. Individual RC samples were collected in calico sample bags Drill core sample intervals were selected by company geologists based on visual mineralisation and geological boundaries with an ideal sample length of one (1) metre. Downhole sampling at 1m intervals provides comprehensive insights into mineralisation characteristics. Drill core samples were sawn longitudinally in half (or quarters for duplicates) onsite using an automatic core saw with half used for analysis and half retained. 								

Criteria	Explanation	Commentary
		<ul style="list-style-type: none"> Independent certified assay laboratories were used for analysis. Samples were analysed at Intertek Genalysis Laboratory in Townsville where samples were crushed to <6 mm, split and pulverised to <75 µm and a sub-sample was collected for analysis via four-acid digest and Inductively Coupled Plasma Optical Emission Spectrometry (ICP-OES) analysis of the following elements: Ag, As, Ba, Bi, Ca, Cu, Fe, K, Mg, Mn, Na, Pb, S, Sb, Ti, Zn, & Zr. Samples were assayed for Au using a 30g Fire Assay technique. <p>SHN – Previous programs</p> <ul style="list-style-type: none"> Industry standard preparation and analysis methods were used. Reverse circulation drill holes were sampled as individual 1m length samples derived through a rig-mounted cone splitter to create a 12.5% split weighing approximately 3-5 kgs. Individual RC samples were collected in calico sample bags and approximately five were secured in each polyweave bag for sample dispatch. Diamond drill holes were predominantly collared with PCD drilling and changed over to HQ3 diamond drilling for completion of the hole. Drill core sample intervals were selected by company geologists based on visual mineralisation and geological boundaries with an ideal sample length of one (1) metre. Downhole sampling at 1m intervals provides comprehensive insights into mineralisation characteristics. The samples were sawn longitudinally in half (or quarters for duplicates) using a Corewise auto core saw, with half used for analysis and half retained. Samples are analysed at Australian Laboratory Services (ALS) in Townsville where samples were crushed to <6 mm, split and pulverised to <75 µm. A sub-sample was collected for a four-acid digest and ICP-OES/MS analysis of 48 elements, including Ag, Cu, Pb and Zn. Samples were also assayed for Au using a 30 g or 50 g Fire Assay technique with AAS finish. Assays returning over 100 g/t Au from this technique were re-assayed using gravimetric analysis. Ba over 1% was re-analysed using XRF. S assays over 10% were re-assayed using induction furnace/IR. <p>SHN – This program</p> <ul style="list-style-type: none"> Industry standard preparation and analysis methods were used. Criteria	Explanation	Commentary
		<p>were crushed to <6 mm, split and pulverised to <75 µm. A sub-sample was collected for a four-acid digest and ICP-OES analysis of 35 elements, including Ag, Cu, Pb and Zn. Samples were also assayed for Au using a 30g Fire Assay technique with AAS finish. Gold assays returning over 100 g/t Au from this technique and silver assays over 1500g/t Ag were re-assayed using gravimetric analysis. Ba over 1% was re-analysed using XRF. S assays over 10% were re-assayed using induction furnace/IR.</p> <ul style="list-style-type: none"> Material believed to be located within voids was also sampled as per normal sampling procedures and noted within the sample log.
Drilling techniques	<p><i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).</i></p>	<p>Historic</p> <ul style="list-style-type: none"> Reverse circulation drill holes utilised a 4 1/4 to 5 1/2 inch hammer bit. Conventional and wireline diamond drilling techniques were used through the various programmes. Core extraction utilised a conventional coring system. Historical core was not oriented. <p>RVR</p> <ul style="list-style-type: none"> Reverse circulation drill holes were between 4 1/4 and 5 1/2 inch hole diameter. Diamond drill core sizes were NQ and HQ. Core extraction utilised a triple tube system with face-sampling bits for precise sample collection. Select holes were orientated using an industry-standard orientation tool. <p>SHN – Previous programs</p> <ul style="list-style-type: none"> Reverse circulation drilling utilised an 8-inch open-hole hammer for the first 10 m (pre-collar) and a 5 1/2 inch RC hammer for the remainder of the drill hole. Diamond drill holes were predominantly collared using PCD before switching to HQ3 core size until completion of the hole. Core extraction utilised a triple tube system with face-sampling bits for precise sample collection. All holes were orientated using a Reflex ACT tool. <p>SHN – This program</p> <ul style="list-style-type: none"> Reverse circulation drilling utilised a 5 1/2 inch RC hammer for the entirety of the drill hole.

Criteria	Explanation	Commentary
Drill sample recovery	<p><i>Method of recording and assessing core and chip sample recoveries and results assessed.</i></p> <p><i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i></p> <p><i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i></p>	<p>Historic</p> <ul style="list-style-type: none"> No information is available on historical drilling recoveries. <p>RVR</p> <ul style="list-style-type: none"> Reverse circulation drill hole recoveries were not routinely recorded but intervals of no return were noted. Diamond drilling recoveries were measured on 50 holes. Overall recoveries were 92.7% across the holes, with most core loss occurring near surface and at a lesser extent around structures. Below 50m depth, recoveries averaged 97.2%. <p>SHN – Previous programs</p> <ul style="list-style-type: none"> Reverse circulation drill hole sample recoveries of less than approximately 80% were noted in the geological/sampling log with a visual estimate of the actual recovery. Very few samples were deemed to have recoveries of less than 80%. No significant mineralised intercepts had recovery <80%. Moisture categorisation was recorded. Some wet RC samples were collected during the 2024 drill campaign. The results of the wet samples were reviewed to ensure appropriate sample recovery was achieved and no smearing of grades was evident. Diamond drill core recoveries are recorded as part of the geological logging. All SHN diamond holes have been measured for recovery and reported an overall recovery of 99.1%. <p>SHN – This program</p> <ul style="list-style-type: none"> Reverse circulation drill hole sample recoveries of less than approximately 1.5kg were noted in the assay register. Average sample weight for the program to date is approximately 2.1kg. Lower recoveries are expected in shallow, unconsolidated ground and in and around voids. Material believed to be located within voids was also sampled as per normal sampling procedures and noted within the sample log.
Logging	<p><i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i></p> <p><i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.</i></p>	<ul style="list-style-type: none"> The following logging was completed on the drill holes: <ul style="list-style-type: none"> Qualitative logging includes lithology, alteration and textures. Quantitative logging includes visual estimate of sulphide and gangue mineral percentages. <p>The logging process, encompassing both qualitative and quantitative data collection, enables a thorough understanding of the geological features present in the drill holes. This information is</p>

Criteria	Explanation	Commentary								
	<p><i>The total length and percentage of the relevant intersections logged.</i></p>	<p>critical for making informed decisions regarding exploration, resource estimation, mining and metallurgical studies.</p> <ul style="list-style-type: none"> Almost 100% logging coverage ensures a thorough dataset, supporting accurate and reliable assessments in subsequent studies. All drill hole logs are stored in a Datashed database platform. Historic data was digitised from original logs or scans of them. RVR logging was undertaken in Microsoft Excel then imported into the inhouse database. SHN personnel entered logging data directly into Geobank for Field Teams 2024 software, which has been set up and customised to SHN requirements with appropriate validation. The SHN Geobank data is then exported to CSV files and sent to an external database consultant, Sample Data Pty Ltd., for loading into the Datashed database platform. Reverse circulation chip samples were sieved and placed into chip trays and are logged to a degree that facilitates robust resource estimation and comprehensive study. Chip trays are stored within the SHN core facility. Drill holes were logged to a level of detail to support this Mineral Resource Estimation. Any inconsistencies in logging or log availability is reflected in the Mineral Resource classification. All drill core from 2007 has been photographed – this captures essential details for further analysis. 								
Sub-sampling techniques and sample preparation	<p><i>If core, whether cut or sawn and whether quarter, half or all core taken.</i></p> <p><i>If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</i></p> <p><i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i></p> <p><i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i></p> <p><i>Measures taken to ensure that the sampling is representative of the in-situ material collected,</i></p>	<ul style="list-style-type: none"> In both reverse circulation and diamond drilling, samples were collected following industry best practices to ensure representativeness and quality. The sampling techniques used were tailored to the specific drilling methods and to each programme: <table border="1" data-bbox="1051 1002 2046 1343"> <thead> <tr> <th data-bbox="1051 1002 1365 1033">Programme</th><th data-bbox="1365 1002 2046 1033">Sampling Method</th></tr> </thead> <tbody> <tr> <td data-bbox="1051 1033 1365 1176">Nickel Mines</td><td data-bbox="1365 1033 2046 1176">Longitudinal half core, size unknown (hand split) – sampled to contacts predominately 1 or 5ft in length. Programme	Sampling Method									
Nickel Mines	Longitudinal half core, size unknown (hand split) – sampled to contacts predominately 1 or 5ft in length. Imperial lengths were subsequently converted to metric for use in the database.									
Esso	Longitudinal half NQ core (core saw) – non-selective samples predominantly 1m in length.									
Great Mines Limited	RC split (riffle splitter) using non-selective samples predominantly 1m in length.									

Criteria	Explanation	Commentary	
<p><i>including for instance results for field duplicate/second-half sampling.</i></p> <p><i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i></p>		Pancontinental	<p>4 1/4 to 5 1/2 inch RC split (riffle splitter) using non-selective samples predominantly 1m in length.</p> <p>Longitudinal half NQ core (core saw) – selective samples predominantly 1m in length.</p>
		Liontown Resources	<p>Longitudinal half NQ2 core (core saw) – sampled to geological contacts predominantly 1m in length.</p>
		Red River Resources	<p>4 1/2 to 5 1/2 inch RC split using a rig-mounted cone splitter, proportion 12.5%, on 1m intervals.</p> <p>Longitudinal half NQ2 core, half HQ3 core and quarter HQ3 core (automatic core saw) – sampled to geological contacts predominantly 0.5m to 1m in length.</p>
		Sunshine Metals	<p>5 1/2 inch RC split using a rig-mounted cone splitter to produce a 12.5% sub-sample on 1m intervals and comprised approximately 2 to 5kg.</p> <p>Longitudinal half HQ3 core (automatic core saw) – sampled to geological contacts predominantly 0.5m to 1m length.</p>
<ul style="list-style-type: none"> Sub-sampling and sample preparation documentation is available for all programmes from 2007 and is considered appropriate for the characteristics of the mineralisation and sufficient to represent the mineralisation style. Rigorous care during sample collection and handling ensures the delivered sample accurately reflects the drilled interval. Sample preparation since 2007 comprised crushing to <6mm split and pulverising to <75 µm in order to produce a representative sub-sample for analysis. Pre-2007 information is limited, however, it is considered the samples would have been prepared to industry standards of the time. Reverse circulation drill samples since 2018 were collected via a rig-mounted cone splitter to produce a 12.5% sub-sample on 1 m intervals and comprised approximately 3 to 5kg. Previous reverse circulation drill samples were collected in 1987 by Great Mines Limited and by Pancontinental in 1994-1996. Collection data on these samples is limited but were likely collected from the cyclone and subsequently split using a separate riffle splitter, the industry standard at the time. Diamond drill core was placed in core trays for logging and sampling. Diamond core was cut longitudinally in half using a core saw in all programmes except that of Nickel Mines (1970-1973) in which drill core was split by hand. 			

Criteria	Explanation	Commentary
		<ul style="list-style-type: none"> • Diamond drill core sample intervals were to geological contacts except for in the Esso and Great Mines Limited programme. This produced a degree of smoothing in that data, as expected. • Diamond drill core sample lengths varied between 0.3m and 2m in length (98% of samples) with 78% ranging from 1m to 2m in length. Mean sample length is 0.94m and so 1m intervals are considered appropriate for mineral resource estimation at the Liotontown Project. • No data is available on historical field duplicate samples. No field duplicates were utilised in RVR drill programmes. Field duplicates were collected by SHN an average rate of one (1) per thirty samples.
Quality of assay data and Laboratory tests	<p><i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i></p> <p><i>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i></p> <p><i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i></p>	<ul style="list-style-type: none"> • Various assay methods were employed at the Liotontown Project in the different drill programmes. Assay methods are considered appropriate for mineral resource estimation of the style and type of mineralisation. • Various degrees of Quality Assurance and Quality Control (QAQC) procedures were implemented in the different drill programmes. Records are available from 2007. Since 2007 it is considered that acceptable levels of accuracy and precision have been established. Given that reputable licensed laboratories were utilised pre-2007 it is considered that acceptable levels of accuracy and precision were established for the purposes of mineral resource estimation. <p>Historic (pre-2007)</p> <ul style="list-style-type: none"> • The majority of the samples were analysed following a three- or four- acid digest and either via Atomic Absorption Spectrum (AAS) or Inductively Coupled Plasma Optical Emission Spectrometry (ICP-OES) for the analysis of base metals. Gold was analysed via Fire Assay using either 25g, 30g or 50g charge with an AAS finish. No information regarding QAQC data is available. <p>Historic (post-2007)</p> <ul style="list-style-type: none"> • The majority of the samples were analysed following a three- or four- acid digest and either via Atomic Absorption Spectrum (AAS) or Inductively Coupled Plasma Optical Emission Spectrometry (ICP-OES) for the analysis of base metals. Gold was analysed via Fire Assay using either 25g, 30g or 50g charge with an AAS finish. • Commencing on drillhole LTD0014, blanks were inserted on either side of observed mineralised intersections and standards were inserted at the rate of about 1 in 30. In 2015 RVR conducted a review into the QAQC procedures and concluded that there were enough results to meet the JORC 2012 requirements for verification of source data. QAQC for blanks was typically good, with two samples analysing slightly high for Au and review of the CRMs suggested that Cu showed a general slight elevation in reporting and Pb showed a slight underreporting (deemed within acceptable limits), and zinc reporting was considered accurate.

Criteria	Explanation	Commentary
		<p>RVR</p> <ul style="list-style-type: none"> Independent certified assay laboratories were used for analysis. Samples were analysed at Intertek Genalysis Laboratory in Townsville where samples were crushed to <6 mm, split and pulverised to <75 µm and a sub-sample was collected for analysis via four-acid digest and Inductively Coupled Plasma Optical Emission Spectrometry (ICP-OES) analysis of the following elements: Ag, As, Ba, Bi, Ca, Cu, Fe, K, Mg, Mn, Na, Pb, S, Sb, Ti, Zn, & Zr. Samples were assayed for Au using a 30g Fire Assay technique. The QAQC procedures involved insertion of blanks at a rate of 1 in 40 and Certified Reference Materials (CRMs) inserted at a rate of 1 in 20, before moving to 1 in 25 after Feb 2022. Banks and CRMs returned results within an acceptable range. No field duplicates were submitted for reverse circulation or diamond drilling. <p>SHN – Previous Programs</p> <ul style="list-style-type: none"> Samples are analysed at Australian Laboratory Services (ALS) in Townsville where samples were crushed to <6 mm, split and pulverised to <75 µm. A sub-sample was collected for a four-acid digest and ICP-OES/MS analysis of 48 elements, including Ag, Cu, Pb and Zn. Samples were also assayed for Au using a 30 g or 50 g Fire Assay technique with AAS finish. Assays returning over 100 g/t Au from this technique were re-assayed using gravimetric analysis. Ba over 1% was re-analysed using XRF. S assays over 10% were re-assayed using induction furnace/IR. The QAQC procedures involved Blanks, Field Duplicates and CRMs inserted at a rate of 1 in 10 and it is considered that acceptable levels of accuracy and precision were established for the purposes of mineral resource estimation. Blank material comprised of “play sand” sourced from a local hardware store. Approximately 0.5kg was inserted into a numbered bag and entered into the sample stream. No significant contamination was reported from blank material. All CRMs were sourced from the reputable industry suppliers OREAS and Geostats Pty Ltd. A 2024 review of CRMs concluded that data quality was “good throughout the programme”, however, a limited number of zones were re-assayed due to CRMs returning results outside of three (3) standard deviations. The re-assaying of these outliers showed original assays were within acceptable levels of accuracy and precision, however, some Au-bearing zones may illustrate localised variability.

Criteria	Explanation	Commentary
		<ul style="list-style-type: none"> Field duplicates were collected as a second split direct from the drill rig for reverse circulation drilling and as longitudinally cut quarter drill core to be compared with the half core original drill core sample. Duplicates were found to be repeatable within acceptable limits. <p>SHN – This Program</p> <ul style="list-style-type: none"> Samples are analysed at Australian Laboratory Services (ALS) in Townsville where samples were crushed to <6 mm, split and pulverised to <75 µm. A sub-sample was collected for a four-acid digest and ICP-OES analysis of 35 elements, including Ag, Cu, Pb and Zn. Samples were also assayed for Au using a 30g Fire Assay technique with AAS finish. Assays returning over 100 g/t Au from this technique and silver assays over 1500g/t Ag were re-assayed using gravimetric analysis. Ba over 1% was re-analysed using XRF. S assays over 10% were re-assayed using induction furnace/IR. Blank material comprised of “play sand” sourced from a local hardware store. Approximately 0.5kg was inserted into a numbered bag and entered into the sample stream. No significant contamination has been reported from blank material. All CRMs were sourced from the reputable industry suppliers Geostats Pty Ltd. All CRMs have returned acceptable values for Au during the program, with no assays outside of 2 standard deviations from certified value. Field duplicates were collected as a second split direct from the drill rig. First pass review has shown acceptable repeatability with 80% repeating within a 20% half-absolute relative difference (HARD).
Verification of sampling and assaying	<p><i>The verification of significant intersections by either independent or alternative company personnel.</i></p> <p><i>The use of twinned holes.</i></p> <p><i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i></p> <p><i>Discuss any adjustment to assay data</i></p>	<ul style="list-style-type: none"> Company geologists conduct meticulous reviews of mineralised intercepts observed in reverse circulation chip trays and diamond core, ensuring a thorough examination of geological features. <p>Historic</p> <ul style="list-style-type: none"> Documentation and information regarding data entry procedures, data verification, and data storage (physical and electronic) protocols is very limited. Available geological logging sheets comprise originals and scanned copies were digitised into RVR's database and subsequently into SHN's Datashed database. A series of twin holes were carried out by Esso of original Nickel Mines holes. On that basis the original drill holes were considered as “likely erroneous” and excluded by Esso and future operators.

Criteria	Explanation	Commentary
		<p>RVR</p> <ul style="list-style-type: none"> RVR data entry procedures, data verification and data storage (physical and electronic) comprised of Microsoft Excel logs and database exports and which have been incorporated into SHN's Dashed database. RVR reportedly twinned several historical drill holes, however it is unclear which holes were specifically designed as twins. <p>SHN</p> <ul style="list-style-type: none"> Previously, SHN twinned one (1) historic RC drill hole also with RC drilling (LLRC187). The replication of mineralised width and grade were considered reasonable. No drill holes within the current program were designed as or are treated as twin holes of existing drill holes. SHN on-site Geologist's logged directly into Geobank for Field Teams software, which has been set up and customised to SHN requirements. The Geobank data is then exported to CSV files and sent to an external database consultant for loading into the Dashed database platform. The Sunshine Metals Ravenswood Consolidated Project drillhole assay database is managed by Sample Data Pty Ltd and each sample records the laboratory analysis method ensuring that suitable methods are utilised. Additional data validation procedures take place within the Dashed database platform and Leapfrog software. Within Dashed, this entails a meticulous process of querying and integrating multiple tables to identify any missing samples and assay results. Simultaneously, Leapfrog, upon importing the assays into the software, employs algorithms to detect and highlight any errors, overlaps, or duplications in intervals, ensuring an accurate dataset. Assay files are received electronically from the laboratory and securely filed on the company's server. These files are then provided to the database manager who loads the data into the company's database. Rigorous validation checks are performed at this stage, ensuring that the integrity and accuracy of the assay data are maintained throughout the entire process. SHN high-grade assays are routinely re-analysed: assays returning over 100 g/t Au from Fire Assay and 1500g Ag are routinely re-assayed using gravimetric analysis, Ba over 1% was re-analysed using XRF and S assays over 10% were re-assayed using induction furnace/IR.
Location of data points	<p><i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i></p>	<p>Historic</p> <ul style="list-style-type: none"> Historic drill collar locations were determined by a variety of methods in different programmes and included DGPS pickup of all 105 historical collars by Lintown Resources in 2007. Historic down hole surveys were taken using Eastman single shot cameras.

Criteria	Explanation	Commentary
	<p><i>Specification of the grid system used. Quality and adequacy of topographic control.</i></p>	<p>RVR</p> <ul style="list-style-type: none"> • All survey activities were executed by an in-house certified surveyor using RTKGPS with <30mm horizontal and vertical accuracy. • Down hole surveys used an industry-standard Reflex singleshot/multishot tool. <p>SHN – Previous Programs</p> <ul style="list-style-type: none"> • All survey activities have been executed by a certified surveyor, Burton Exploration Services, using PPKGPS with <30mm horizontal and vertical accuracy. This included all new and available historical drill collars. Any historical collars collected superseded previous collar pickups. • Downhole surveys employed an industry-standard Reflex Sprint-IQ gyroscopic survey tool under the management and calibration procedures of Eagle Drilling NQ Pty Ltd. • The grid system applied is UTM MGA 1994 Zone 55. • Drilling by Sunshine 2025 provided more certainty on the location and extensiveness of historical workings, leading to updates in the void model used. In the oxide zone, as-built shapes are used as the depleted voids and sterilised from this Resource. Within the fresh material, the 20m buffer zone around the as-builts used in the 2024 Liontown MRE has also been removed, however all all resources within the buffer zone have been downgraded to the inferred category to reflect this remaining uncertainty. <p>SHN – This Program</p> <ul style="list-style-type: none"> • All drill collars were marked prior to drilling by a certified surveyor, Burton Exploration Services, using PPKGPS with <30mm horizontal and vertical accuracy. Several of these drill hole collars have since been picked up in the same manner, with the remaining holes currently marked by handheld GPS, with PPKGPS pickup scheduled for January 2026.
Data spacing and distribution	<p><i>Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied.</i></p>	<p>Historic</p> <ul style="list-style-type: none"> • Drill hole spacing ranges from 15m to approximately 30m. • Most holes were angled and drilled roughly due north. Most historic holes have drilled within a 1 m east-west trend. <p>RVR & SHN</p> <ul style="list-style-type: none"> • Drill hole spacing ranges from 5m to approximately 25m. Drill holes were designed within the current program to close drill spacing to approximately 12.5m to provide significant confidence in Resource for Reserve categorisation.

Criteria	Explanation	Commentary
		<ul style="list-style-type: none"> Most holes were angled and drilled roughly due north. Mean length of recorded samples is approximately 0.99 metres across all samples. The choice of designating 1 metre as the composite length is based on the data's distribution and practicality, given the prevalence of one (1) metre samples. The drill spacing provides evidence of mineralised zone continuity for the purposes of resource estimation and is reflected in the classification level. Samples were composited within the mineralisation interpretation.
Orientation of data in relation to geological structure	<p><i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i></p> <p><i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i></p>	<ul style="list-style-type: none"> Where possible, holes were orientated to ensure drill intersections were approximately perpendicular to the strike of the ore lenses and overall geological sequence. Dip intersections to the plane of mineralisation generally occur between 45° and 80°. Objective of drilling was directly to intercept mineralised lenses and structures. Drill spacing is considered regular although as expected the most well-defined zones are shallower and central to the orebody. No potential sampling bias is expected. The drilling pattern and orientation is deemed to have appropriately intercepted the ore lenses and stratigraphy.
Sample security	<p><i>The measures taken to ensure sample security.</i></p>	<p>Historic</p> <ul style="list-style-type: none"> Sample security for historic programmes lack information and cannot be validated. <p>RVR</p> <ul style="list-style-type: none"> Samples were acquired on-site by competent geologists, each labelled with a unique sample ID, with five (5) samples grouped into a labelled polyweave bag and transported securely to Intertek Genalysis Laboratory in Townsville establishing a rigorous chain of custody in accordance with industry standards. <p>SHN</p> <ul style="list-style-type: none"> Samples were acquired on-site by competent geologists, each labelled with a unique sample ID, with five (5) samples grouped into a labelled polyweave bag and transported securely, either by SHN or through a local freight company, to ALS Townsville establishing a rigorous chain of custody in accordance with industry standards.
Audits or reviews	<p><i>The results of any audits or reviews of sampling techniques and data.</i></p>	<p>Historic</p> <ul style="list-style-type: none"> Pre-2008 reviews were carried out and documented by the various previous owners of the project including:

Section 2 - Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	Explanation	Commentary
Mineral tenement and land tenure status	<p><i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i></p> <p><i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i></p>	<ul style="list-style-type: none"> ● Ravenswood Consolidated Exploration Permits are: EPMs 10582, 12766, 14161, 16929, 18470, 18471, 18713, 25815, 25895, 26041, 26152, 26303, 26304, 26718, 27537, 27520, 27824, 27825, 28237, 28240, Mining Lease 10277 and Mining Lease Applications 100221, 100290 and 100302 for a total of 1,326km². The tenements are in good standing and no known impediments exist. These leases are held in their entirety by Sunshine (Ravenswood) Pty Ltd and Sunshine (Triumph) Pty Ltd, 100% owned subsidiaries of Sunshine Metals Ltd. ● The Lιontown Resource is located in its entirety on ML 10277 and EPM 14161 and under Mining Lease Applications MLA 100290 and MLA 100302. ● The Thalanga mill and mining operation was abandoned by administrators to Red River Resources. A restricted area has been placed over the mill, dumps and tailings facilities. The Queensland Department of Environment is now responsible for the rehabilitation of the aforementioned facilities. There are no known other Restricted Areas located within the tenure. ● Lιontown exists on the recognised native land of the Jangga People #2 claim. ● A 0.8% Net Smelter Return (NSR) royalty is payable to Osisko Ventures Ltd and a 0.7% NSR royalty payable to the Guandong Guangxin Mine Resources Group Co Ltd (GMRG) on sale proceeds of product extracted from EPM 14161.

Criteria	Explanation	Commentary
Exploration done by other parties	<p><i>Acknowledgment and appraisal of exploration by other parties.</i></p>	<ul style="list-style-type: none"> The Liotown deposit was discovered in 1905 by William Fredrick Carrington, whilst searching for his horses "Lion and Noble". The Cu-Au enriched zone was mined using underground development from 1905 to 1911, producing 28,000 ounces of gold at an average grade of 22g/t Au (Levingston, 1972). A second phase of mining occurred from 1951 to 1954 after Parsons and Jansen discovered the Pb-Zn-Ag enriched stratiform sulphide lenses, producing 54,000 ounces of silver and 9 tonnes of lead (Levingston, 1972). 1952 – 1953: Broken Hill South Limited drilled 3 diamond drill holes at Liotown, intersecting high-grade Pb-Zn-Ag (total of 292m drilling). 1957 - 1961: Queensland Mines Department completed 21 diamond drill holes at Liotown (1034m). In 1952 & 1959 EM surveys were carried out. 1960-1961 8 DD holes (896m) were drilled to test the EM anomalies but poor results were encountered. 1967 - 1968: Carpentaria Exploration Company conducted geochemical and geophysical surveys. 1970 - 1972: Jododex Australia held ground surrounding the Nickel Mines Lease with Shelley (1973) recognising that mineralisation is conformable with stratigraphy and exhibits features seen in volcanic ore deposits. 1970 - 1971: Nickel Mines drilled 59 diamond drill holes for 7669m in total at Liotown. The programme was poorly documented and is now considered to be unreliable. As such, they have not been used within the current resource update. 1982 - 1984: Esso Minerals carried out an extensive exploration programme across the region, under a JV agreement with Great Mines. The programme consisted of extensive RAB drilling, soil sampling, geophysics, RC drilling and diamond drilling holes at Liotown. A total of 30 lines of IP and 2.1 km² of EM were also completed over the Liotown area. 1987: Great Mines Limited drilled 50 shallow RC drill holes 1994 -1996: Pancontinental drilled 124 holes for 14,316m. Most of the drilling was conducted at Liotown and along the Liotown horizon looking for repeat lenses. 2004-2009: the project was acquired by Bullion Minerals Ltd, subsequently, Uranium Equities Limited and then Liotown Resources Ltd, Uranium Equities undertook a programme of 580 soil samples and a VTEM survey within the broader Liotown area before following up with RC and Diamond Drilling at Liotown, which was continued by Liotown Resources. A JORC 2004 compliant Mineral Resource Estimate (MRE) was reported in 2008 of; 1.64Mt @ 7.4% Zn, 0.49% Cu, 2.3% Pb, 0.5g/t Au & 28g/t Ag (sulphide) & 0.2Mt 7.4 % Zn, 1.12% Cu, 3.1% Pb, 0.96g/t Au & 31g/t Ag (oxide). Limited work was conducted following this period and the project was subsequently joint ventured to Ramelius Resources (2010 – 2013) and Kagara Ltd (2013 -2014) both of which conducted desktop reviews.

Criteria	Explanation	Commentary
		<ul style="list-style-type: none"> The tenure was acquired by Red River Resources in 2015 who subsequently reported a JORC 2012 compliant MRE update of; 2.04Mt @ 4.60% Zn, 0.50% Cu, 1.6% Pb, 0.8g/t Au & 26g/t Ag (sulphide) & 0.22mt 4.65 % Zn, 0.95% Cu, 1.33% Pb, 0.95g/t Au & 15g/t Ag (oxide). IP reprocessing of historical data and followed up with 9-lines of dipole-dipole IP within the tenure area. The reprocessing of the historical data aided follow-up targeting at Liontown East at which mineralisation was successfully drilled in 2017. Further drilling occurred at Liontown in 2018 through to 2020 and included a second Red River Resources JORC 2012 compliant MRE update for Liontown and Liontown East combined of; 4.1Mt @ 5.9% Zn, 0.6% Cu, 1.9% Pb, 1.1g/t Au & 29g/t Ag (sulphide) & 0.1Mt @1.9g/tAu & 24g/t Ag (oxide) in 2020. The tenure was acquired by Sunshine Metals Ltd in 2023. Sunshine reported a JORC 2012 compliant MRE update Liontown and Liontown East combined using different metal price assumptions to report; 3.9Mt @ 6.1% Zn, 0.65% Cu, 1.99% Pb, 1.2g/t Au & 31g/t Ag (sulphide) & 0.15Mt @2.1g/t Au & 30g/t Ag (oxide) in February 2024.
Geology	<p><i>Deposit type, geological setting and style of mineralisation.</i></p>	<p><u>Regional Geology and Setting:</u></p> <p>The Project area is located within the Charters Towers Province which extends inland from the coast at Townsville to 150km west of Charters Towers. The rocks are typically Neoproterozoic to Palaeozoic age. It is bound in the southeast by the New England Orogen and to the north by the Broken River Province of the Mossman Orogen. The known VMS deposits, including Liontown, are hosted within the stratigraphy of the Mt Windsor Sub-province, which encompasses the dismembered remnants of a thick volcanic and sedimentary succession predominantly of Late Cambrian and Early Ordovician age located within the northern part of the Tasman Orogenic Zone (Henderson, 1986). The succession comprises of four identified formations collectively known as the Seventy Mile Range Group, which outcrop discontinuously in an east-west belt south of the Ravenswood Batholith. The Seventy Mile Range Group (499 – 479 Ma) ranges from Late Cambrian to Early Ordovician and is represented by the Puddler Creek Formation at the base, followed by the Mt Windsor Volcanics, the Trooper Creek Formation and the Rollston Range Formation at the top. The Trooper Creek Formation consists of intermediate lavas, volcaniclastics (including mass flow deposits), minor felsic rocks and marine sediments (Henderson, 1986). The facies assemblage has been interpreted as being deposited proximal to submarine volcanic centres and is known to host VMS deposits, such as Thalanga, Liontown and Highway-Reward. The Group is variably overlain by Tertiary and Quaternary cover sequences, including the Campaspe Formation which comprises immature and pebbly sandstone and minor siltstone interbeds and is interpreted to represent erosive channel fill and fluvial sheet deposition.</p>

Criteria	Explanation	Commentary
		<p><u>Local Geology:</u></p> <p>The Liotontown deposit mineralisation is hosted within Cambro-Ordovician marine volcanic and volcano-sedimentary sequences of the Mt Windsor Volcanic sub-province. The Liotontown and Liotontown East deposits are volcanogenic massive sulphide (VMS) base metal style deposits, which typically are exhibited as lense-like massive to stringer sulphides comprised of sphalerite, galena, chalcopyrite and pyrite. Gold is hosted as free gold and is typically seen with quartz and chalcopyrite. The main lenses are in and around the contact a sequence of marine sediments and a rhyodacite pumice breccia. SHN has identified a distinct zonation of the deposit, which broadly shows Zn-dominant hangingwall lodes and a Cu-Au dominant footwall with potential sub-vertical feeder structures.</p>
Drill hole Information	<p><i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i></p> <ul style="list-style-type: none"> <i>easting and northing of the drill hole collar</i> <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> <i>dip and azimuth of the hole</i> <i>down hole length and interception depth</i> <i>hole length.</i> <p><i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case</i></p>	<ul style="list-style-type: none"> Drill hole data for new drill holes is provided within this ASX release. Raw interval length for this drill program is 1m. Drill intersections from 323 drill holes were used in the 2025 mineral resource estimation, 78 of which were drilled by Sunshine Metals Ltd.

Criteria	Explanation	Commentary
Data aggregation methods	<p><i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</i></p> <p><i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i></p> <p><i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i></p>	<ul style="list-style-type: none"> • All new assays reported within this ASX release are comprised of original 1m samples, as per collected on the drill rig. • Material believed to be located within voids was also sampled as per normal sampling procedures and noted within the sample log. Samples which are believed to be located within voids are reported within the significant intersections but no distinction between whether the material is in-situ or fill is made. • Where sample weight was not sufficient for analysis (e.g. within an empty void) the sample has been treated as zero grade for conservative reporting purposes within any significant intersections. <p>MRE Notes:</p> <ul style="list-style-type: none"> • The dominant composite length is 1m. • The gold and zinc equivalent grades for Greater Liontown (g/t AuEq, % ZnEq) are based on the following prices: <ul style="list-style-type: none"> • US\$2,900t Zn, US\$9,500t Cu, US\$2,000t Pb, US\$2,500oz Au, US\$30oz Ag. • Metallurgical metal recoveries are broken into two domains: copper-gold dominant and zinc dominant. Each domain and associated recoveries are supported by metallurgical test work and are: <u>Copper-gold dominant</u> – 92.3% Cu, 86.0% Au, <u>Zinc dominant</u> 88.8% Zn, 80% Cu, 70% Pb, 65% Au, 65% Ag. • The AuEq calculation is as follows: $AuEq = (Zn\ grade\% * Zn\ recovery * (Zn\ price\ \$/t * 0.01 / (Au\ price\ \$/oz / 31.103))) + (Cu\ grade\% * Cu\ recovery\% * (Cu\ price\ \$/t / (Au\ price\ \$/oz / 31.103))) + (Pb\ grade\% * Pb\ recovery\% * (Pb\ price\ \$/t / (Au\ price\ \$/oz / 31.103))) + (Au\ grade\ g/t / 31.103 * Au\ recovery\%) + (Ag\ grade\ g/t / 31.103 * Ag\ recovery\% * ((Ag\ price\ \$/oz / 31.103 / (Au\ price\ \$/oz / 31.103)))$ • The ZnEq calculation is as follows: $ZnEq = (Zn\ grade\% * Zn\ recovery) + (Cu\ grade\% * Cu\ recovery\% * (Cu\ price\ \$/t / Zn\ price\ \$/t * 0.01)) + (Pb\ grade\% * Pb\ recovery\% * (Pb\ price\ \$/t / Zn\ price\ \$/t * 0.01)) + (Au\ grade\ g/t / 31.103 * Au\ recovery\% * ((Au\ price\ \$/oz / 31.103) / Zn\ price\ \$/t * 0.01)) + (Ag\ grade\ g/t / 31.103 * Ag\ recovery\% * ((Ag\ price\ \$/oz / 31.103) / Zn\ price\ \$/t * 0.01))$ • No top-cut or capping was applied. Instead, a clamping method at specific search distances and value thresholds was employed to reduce statistical bias.
Relationship between mineralisation widths and	<p><i>These relationships are particularly important in the reporting of Exploration Results.</i></p> <p><i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the down hole</i></p>	<ul style="list-style-type: none"> • The stratiform mineralisation is interpreted to be dipping at approximately 70 degrees towards a bearing of 180 degrees. • A variety of drill hole angles have been drilled with the majority intercepting the strike of mineralisation perpendicular and the plane of mineralisation at angles between 90 and 45 degrees. Interpreted feeder structures are interpreted to dip more steeply between at 80 to 90

Criteria	Explanation	Commentary
intercept length	<p><i>lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</i></p>	<p>degrees at a similar bearing of approximately 180 degrees.</p> <ul style="list-style-type: none"> True widths of intercepts are likely to be between 40% and 80% of down hole widths. Lode mineralisation widths are generally between 0.1m and 12m true width and averaging 1.7m. Sample lengths are most commonly 1m of downhole length. Note some smaller true widths are observed to assist in controlling mineralisation interpretation. These areas are considered in the classification.
Diagrams	<p><i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i></p>	<ul style="list-style-type: none"> Maps and sections showing drill hole intercepts are contained within the body of the release
Balanced reporting	<p><i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practised to avoid misleading reporting of Exploration Results.</i></p>	<ul style="list-style-type: none"> The Sunshine Metals Liantown Project 2025 MRE was produced by Measured Group based on information provided by Sunshine Metals. The resource report contains summary information for all historic drilling and sampling campaigns within the Project area and provides a representative range of grades intersected in the relevant drill holes. No new exploration results are reported here. The application of estimation reduces anomalous grade bias in the representation of mineralisation interpretation of Liantown.
Other substantive exploration data	<p><i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i></p>	<ul style="list-style-type: none"> Geological observations: Historical mapping has validated the stratigraphy in the area, although limited outcrop is present. Historical shafts have been located and sighted by SHN confirming the presence of the historical mining activities and validating the location of the workings. Geophysical survey results: Induced Polarisation has been shown to be an effective exploration tool at Liantown and was used in targeting for the discovery of the Liantown East deposit. Geochemical survey results: Historical mining has affected the reliability of soil sampling in the immediate Liantown area, however base metal (Cu, Pb, Zn) and Au anomalism in soil is deemed to be a useful exploration technique for VMS deposits within the region. Bulk density: Samples were collected by SHN during its core drilling programme at a rate of 1 in 10m for unmineralised rock and 1 in 2m to 5m for mineralised rock. Future drill programmes will also collect additional bulk density data.
Further work	<p><i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i></p> <p><i>Diagrams clearly highlighting the areas of possible extensions, including the main geological</i></p>	<ul style="list-style-type: none"> Further drilling will be required to test geological interpretation and targeting of additional lenses and increase resource confidence. Additional modelling and resource estimation will be undertaken to incorporate the new assays and increase resource confidence, as per the objective of this drill program.

Criteria	Explanation	Commentary
	<i>interpretations and future drilling areas, provided this information is not commercially sensitive.</i>
