CLARIFICATION ANNOUNCEMENT

RC DRILLING TO COMMENCE AT ROE HILLS JOGMEC JOINT VENTURE

Alchemy Resources Limited provides supplementary information to the ASX release titled 'RC Drilling to Commence at Roe Hills JOGMEC Joint Venture' dated 19 January 2026, by way of the inclusion of Figures 4 to 7 showing drillhole collars in plan with hole identification and representative sections and assays, as required by JORC Code disclosures.

The below version of the announcement has been amended to reflect these additions.

HIGHLIGHTS

- RC drilling is planned to commence targeting anomalism in aircore drilling at high priority lithium targets at the Roe Hills Project areas in Western Australia.
- The drill program comprises up to nine RC holes for approximately 1,500m of drilling which is expected to take two weeks to complete.
- Aircore drilling was completed in late 2025 with assay results returning multiple areas of coincident lithium and pathfinder anomalism.
- Field validation of results indicates anomalous zones are related to either outcropping pegmatite or new pegmatites discovered in drilling.
- Work is undertaken as part of the Farm-in and Joint Venture with JOGMEC.
- JOGMEC has the right to earn a 51% interest by expending \$6,000,000 by 31 March 2029.

Alchemy Resources Limited (ASX: ALY) ("Alchemy" or "the Company") is pleased to announce that drilling has delineated multiple lithium and pathfinder anomalies at the Roe Hills farm-in and Joint Venture ("JV") area in Western Australia. These anomalies are situated over major structural trends which sit along strike from Global Lithium Resources (ASX:GL1) Manna deposit to the north-east. Aircore drilling identified several high priority targets with coincident lithium caesium tantalum ("LCT") pathfinder anomalism along with outcropping pegmatites which will be tested with reverse circulation ("RC") drilling during the current drill program.

Chief Executive Officer Mr James Wilson commented: *"The upcoming RC drill program at Roe Hills marks an important step in advancing what is shaping up to be a highly prospective and under-explored pegmatite system in Western Australia. This campaign has been designed to follow up a series of compelling geochemical results generated from our late-2025 aircore drilling, which identified multiple zones of coincident lithium and key pathfinder anomalism across several high-priority target areas."*

These results are particularly encouraging as they demonstrate a coherent geochemical footprint that is consistent with fertile LCT-style pegmatite systems, providing strong technical support for immediate drill testing. Many of these anomalous zones are spatially associated with outcropping pegmatites and newly recognised pegmatite bodies intersected in drilling. This significantly upgrades the quality of the targets, as it demonstrates that the geochemical responses are linked to real geological sources rather than transported or background noise."

Figure 1: Alchemy's Western Australian projects and the Roe Hills Joint Venture

AIRCORE DRILL PROGRAM RESULTS

A total of 211 aircore (“AC”) drillholes were completed over the three initial target areas. These targets were identified through a multi-layered approach incorporating soil geochemistry, LiDAR and orthophoto interpretation, structural analysis, and field mapping.

Drill planning has focused on areas where structural complexity, geochemical pathfinder element anomalism, and mapped or interpreted felsic dykes coincide. These targeting criteria have been applied to maximise the likelihood of intersecting geochemical halos associated with LCT pegmatite systems, even in the absence of direct outcrop. By leveraging these combined datasets, Alchemy is able to rapidly assess the fertility of key structural corridors and prioritise zones for further follow-up.

Several geochemical corridors show strong continuity along and between drill lines. Areas where lithium (Li), caesium (Cs) and rubidium (Rb) overlap — supported by tantalum (Ta), tin (Sn) and niobium (Nb) — are considered the most prospective and are used as key exploration vectors.

These corridors were identified by analysing the full Roe Hills drilling geochemistry dataset. Each LCT pathfinder element (Li, Cs, Rb, Ta, Sn, Be and Nb) was first mapped individually to locate zones of elevated values. These results were then combined to identify areas where multiple elements occur together, increasing confidence that the anomalies are real and meaningful. This process defined a series of anomalous corridors with varying levels of strength and continuity.

Targets were then ranked based on how strong and consistent the geochemical anomalies are, the type of rocks encountered in drilling, and how they relate to interpreted geological structures. Corridors where strong multi-element geochemistry aligns with favourable geology and structure were given the highest priority.

Based on this work, five priority targets have been defined. Each represents a coherent zone of multi-element anomalism that warrants follow-up drilling and further evaluation.

The primary target area for the current program sits on the western edge of the tenement and will be tested in the current round of RC drilling.

Figure 7: Aircore Drilling Section

NEXT STEPS

RC drilling aimed at testing the deeper primary targets is expected to be completed in late January 2026. Planning is underway to assess the other anomalous zones and the potential for follow-up programs using aircore drilling.

JOGMEC Farm-in and Joint Venture (E28/2681, E28/2880, E28/2976)

Roe Hills lies along a distinctive structural trend from the pegmatite field that hosts the Manna Lithium deposit, 5km to the north-east and owned by Global Lithium Resources (ASX: GL1). Geological Survey of Western Australia mapping has identified a high-density of narrow plagioclase dykes, porphyritic dykes and quartz veins adjacent to a granite contact zone. Multi-element soil sampling conducted by Alchemy in 2018-2024 highlighted multiple areas of low-level lithium anomalism and coincident pathfinder anomalism across a broad strike extent. Mapped dykes appear to have a north-south strike extent, parallel to the greenstone/granite contact, however most of the areas around the known mapped dykes are covered by alluvium and it is likely that these areas are far more extensive than the known outcrops.

In September 2024, a Farm-in and JV agreement was signed between Alchemy and Japan Organization for Metals and Energy Security (“JOGMEC”), and in December 2024 Australian Government Foreign Investment Review Board (“FIRB”) approval was received for the Farm-in and JV. The JV covers sections of the Roe Hills target areas covering 248km². The areas are considered highly prospective for the discovery of lithium similar in style to the neighbouring Manna lithium deposit located in the adjacent tenure to the east. JOGMEC has the right to earn a 51% interest by expending \$6,000,000 by 31 March 2029.

EXPLORATION OUTLOOK (Excluding JV Activities)

Planning for the 2026 Field Program is currently underway.

Upcoming news flow and activities includes:

- Results from IP Surveys at Yellow Mountain Copper-gold project in New South Wales.
- Heritage Survey Clearance at Yellow Mountain for follow-up drilling – expected to commence in February 2026.
- 2026 Drilling on multiple Projects including, but not limited to:
 - Yellow Mountain Copper-Gold project follow-up RC drilling
 - Overflow Gold Project RC drilling
 - Taupo Gold Project RC drilling
 - Challenger Gold Project RC drilling
 - Valley Bore Iron Ore Project follow-up RC drilling

ABOUT ALCHEMY RESOURCES

Alchemy Resources Limited (ASX: ALY; “Alchemy” or the “Company”) is an Australian exploration company focused on growth through the discovery and development of gold, base metal and battery metals within Australia. Alchemy has built a significant land package in the Carosue Dam - Karonie greenstone belt in the Eastern Goldfields region in Western Australia and has an 80% interest in the Lachlan/Cobar Basin Projects in New South Wales. Alchemy also has an interest in the Bryah Basin Project, located in the gold, iron ore and base metal-rich Gascoyne region of Western Australia, where Catalyst Metals (ASX: CYL) is continuing to advance gold exploration.

This announcement has been approved for release by the Board.

COMPETENT PERSON STATEMENT

The information in this report that relates to Exploration Results is based on information compiled by Mr James Wilson, who is the Chief Executive Officer of Alchemy Resources Limited and holds shares and options in the Company. Mr Wilson is a Member of the Australian Institute of Geoscientists and has sufficient experience of relevance to the styles of mineralisation and the types of deposits under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' ('JORC Code 2012'). Mr Wilson consents to the inclusion in this report of the matters based on his information in the form and context in which it appears.

Forward looking statements: This announcement contains "forward-looking statements", including statements about the scheduling of exploration and drilling programs. All statements other than those of historical facts included in this announcement, are forward-looking statements. Forward-looking statements are subject to risks, uncertainties, and other factors, which could cause actual events or results to differ materially from future events or results expressed, projected or implied by such forward-looking statements. The Company does not undertake to release publicly any revisions to any "forward-looking statement" to reflect events or circumstances after the date of this announcement, or to reflect the occurrence of unanticipated events, except as may be required under applicable securities laws.

APPENDIX 1

JORC CODE, 2012 Edition Table 1

Section 1 Sampling Techniques and Data – Aircore Drilling

Criteria	JORC Code explanation	Commentary
Sampling techniques	<i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialized industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</i> <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> <i>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where ‘industry standard’ work has been done this would be relatively simple (e.g. ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverized to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i>	Aircore (AC) samples were collected in a bucket from a cyclone and laid out on ground in chronological order. 5m intervals were sampled using a scoop. A 1m Bottom of Hole (BOH) sample was taken from each hole. Each sample weighed approximately 3kg.
Drilling techniques	<i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).</i>	All AC drilling was completed by a Bostech Drill boss 200.
Drill sample recovery	<i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	Sample recovery data was noted in geological comments as part of the logging process. Sample condition has been logged for every metre interval as part of the logging process. Water was encountered during drilling resulting in minor wet and moist samples with the majority being dry. No quantitative twinned drilling analysis has been undertaken.
Logging	<i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral</i>	Geological logging of all RC chips in 1m intervals of the drilling was completed in Microsoft Excel on Toughbook laptops on site. Colour, Lithology,

Criteria	JORC Code explanation	Commentary
	<i>Resource estimation, mining studies and metallurgical studies.</i> <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.</i> <i>The total length and percentage of the relevant intersections logged.</i>	structure, texture, veining, sulphide content, alteration, weathering details were all captured. All drillhole logging was validated and uploaded into the Company's datashed database. Photographs of all holes were taken and stored on the Company's online storage. All drill holes were chipped and stored in labelled chip trays. Drill chip trays are stored on site and made accessible for future validation.
Sub-sampling techniques and sample preparation	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> <i>If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</i> <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> <i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i> <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	Sample preparation of Alchemy samples follows industry best practice standards at accredited laboratories. Sample preparation comprises oven drying, jaw crushing and pulverising to -75 microns (80% first pass). Sample sizes (1.5kg – 5kg) are considered appropriate for the technique. RC samples consist of 1m split samples and 4m speared composite samples taken in the field. All samples were subsequently delivered to the ALS Laboratory in Kalgoorlie where they were freighted to ALS in Perth where Multielement analysis is completed.
Quality of Assay data and laboratory tests	<i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> <i>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> <i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i>	All drilling samples were analysed by 4-acid digest ICP-MS (ME-MS61) analysis at ALS laboratories. Standards were inserted every 40 samples for QAQC purposes. The analytical techniques and quality control protocols used are considered appropriate for the data to be used.
Verification of sampling and assaying	<i>The verification of significant intersections by either independent or alternative company personnel.</i> <i>The use of twinned holes</i>	All significant intersections were verified by alternative company personnel. No twinned holes or drilling results are reported.

Criteria	JORC Code explanation	Commentary
	<i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data.</i>	No adjustments were made to assay data.
<i>Location of data points</i>	<i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control.</i>	A handheld GPS was used to locate the data positions, with an expected +/-5m vertical and horizontal accuracy. The grid system used for all collar locations is the UTM Geocentric Datum of Australia 1994 (MGA94 Zone 51). GPS measurements of sample positions are sufficiently accurate for first pass geochemical sampling. Nominal RLs were assigned from 1 sec (30m) satellite data.
<i>Data spacing and distribution</i>	<i>Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied.</i>	Drill lines were spaced approximately 400m – 800m apart, with 200m spaced holes along those drill lines.
<i>Orientation of data in relation to geological structure</i>	<i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i>	Drill lines are dominantly perpendicular to regional geological trends where interpreted and practical. The spacing and location of the data is considered suitable for initial exploration purposes.
<i>Sample security</i>	<i>The measures taken to ensure sample security.</i>	Samples are collected in polyweave bags and delivered directly from site to the assay laboratory in Kalgoorlie by Alchemy employees.
<i>Audits or reviews</i>	<i>The results of any audits or reviews of sampling techniques and data.</i>	Considering the preliminary nature of the drill program, no external audit or review of the sampling techniques or sample data capture has been conducted to date. No review has been carried out to date. Group technical reviews are carried out periodically.

Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
<i>Mineral tenement and land tenure status</i>	<i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i>	Type – Exploration Licence (currently in good standing). Reference name – Roe Hills. Reference number – E28/2681 and E28/2976. Location – 100km East of Kalgoorlie, WA, Australia. Ownership – 100% Goldtribe Pty Ltd (a wholly owned subsidiary of Alchemy Resources Limited). JOGMEC are currently Farming in to earn 51% of the project. Overriding royalties – none. No Wilderness Reserves, National Parks, Native Title sites or registered historical sites are known. No environmental issues are known.
<i>Exploration done by other parties</i>	<i>Acknowledgment and appraisal of exploration by other parties.</i>	A significant amount of exploration has been conducted across E28/2681 and E28/2976. Previous exploration companies include WMC, Croesus Mining, Avoca Resources, Heron Resources, Integra Mining, Breaker Resources. Exploration work completed has included desktop studies and collaborative research, geological and regolith mapping, soil sampling, RAB, Aircore, RC and diamond drilling, and numerous airborne and ground geophysical surveys.
<i>Geology</i>	<i>Deposit type, geological setting and style of mineralisation</i>	Deposit Type – Lithium, Cesium, Tantalum (LCT) Pegmatite. The Roe Hills Project is situated within the Menangina Domain of the Kurnalpi Terrane, part of the Eastern Goldfields Superterrane. The host rocks, dated between approximately 2.72 and 2.68 Ga, are interpreted through geochemical signatures as representing an arc basin setting. Structurally, the greenstone sequences record a prolonged deformation history, resulting in steep west-dipping lithological contacts and a consistent north-northwest foliation. These structural features are broadly analogous to those documented in the adjacent Kalgoorlie Terrane, although the granitoid intrusions in the Kurnalpi Terrane post-date greenstone formation, contrasting with the TTG-related granites of Kalgoorlie.

Criteria	JORC Code explanation	Commentary
<i>Drill hole Information</i>	<i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <i>- easting and northing of the drill hole collar</i> <i>- elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> <i>- dip and azimuth of the hole</i> <i>- down hole length and interception depth</i> <i>- hole length.</i> <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i>	A list of the drill hole coordinates, orientations and intersections reported in this announcement are provided as an appended table in Appendix 1.
<i>Data aggregation methods</i>	<i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i> <i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i> <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i>	No levelling of the raw geochemical data was undertaken.
<i>Relationship between mineralisation widths and intercept lengths</i>	<i>These relationships are particularly important in the reporting of Exploration Results.</i> <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. ‘down hole length, true width not known’).</i>	All drilling was conducted using appropriate perpendicular orientations for interpreted mineralisation.

Criteria	JORC Code explanation	Commentary
<i>Diagrams</i>	<i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i>	Appropriate plans and sections have been included in the body of this announcement.
<i>Balanced reporting</i>	<i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced avoiding misleading reporting of Exploration Results.</i>	Not applicable.
<i>Other substantive exploration data</i>	<i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	All meaningful data and relevant information have been included in the body of the report.
<i>Further work</i>	<i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i>	Appropriate further work is provided in the body of the report.
