ASX ANNOUNCEMENT

RELEASED 4 FEBRUARY 2026

Drilling Strengthens Gold Continuity at Van Uden

Highlights

- **Further assays received from resource definition drilling at Van Uden**
- **High tenor results continue, inclusive of:**
  - **13m @ 2.26 g/t Au**
  - **13m @ 1.48 g/t Au**
  - **10m @ 1.75 g/t Au**
- **Results confirm continuity and up-dip (shallow) extensions to the current MRE[1]**
- **Diamond core drilling underway to extend MRE and provide geotechnical data for future mining**
- **Results for 24 drillholes remain outstanding, including step-out exploration drilling south of the Van Uden current MRE**

TG Metals Limited (**TG Metals** or the **Company**) (ASX:TG6) is pleased to provide further results from drilling at the Van Uden Gold Project (**Van Uden** or the **Project**).

These results are from 52 reverse circulation (RC) drillholes in the entire length of the Van Uden gold deposit (**Figure 1**), targeting resource extensions and infill drilling. Multiple gold zones intercepted showing increasing continuity. Result highlights include:

- **TGGR132 - 13m @ 2.26 g/t Au from 48.0m, including 1m @ 9.17 g/t from 55.0m**
- **TGGR109 - 13m @ 1.48 g/t Au from 18.0m**
- **TGGR152 - 10m @ 1.75 g/t Au from 44.0m, including 1m @ 8.55 g/t Au from 45.0m**
- **TGGR111 - 5m @ 2.94 g/t Au from 44.0m, including 1m @ 8.05 g/t Au from 46.0m**
- **TGGR058 - 5m @ 2.60 g/t Au from 84.0m, including 1m @ 8.95 g/t Au from 84.0m**

TG Metals CEO, Mr. David Selfe stated;

"Assay results continue to be received from the December quarter 2025 drilling program at Van Uden. They confirm the continuity of the mineralised trends and the results are expected to add significant gold ounces to an updated MRE targeted for release in March. Diamond core drilling has recently commenced, extending some previously drilled RC holes and also providing vital geotechnical information to assist mining studies. We are looking forward to receipt of the remainder of the RC drill assays and our first diamond drill core samples."

1: MRE - See Table A

Van Uden Drilling

The ongoing purpose of this drilling campaign is to expand on the current Van Uden mineral resource estimate (MRE) via infill and down dip extensions and to provide data to improve our geological understanding. These results are from the entire length of the Van Uden deposit, **Figure 1** shows the location of the reported results for these drillholes.

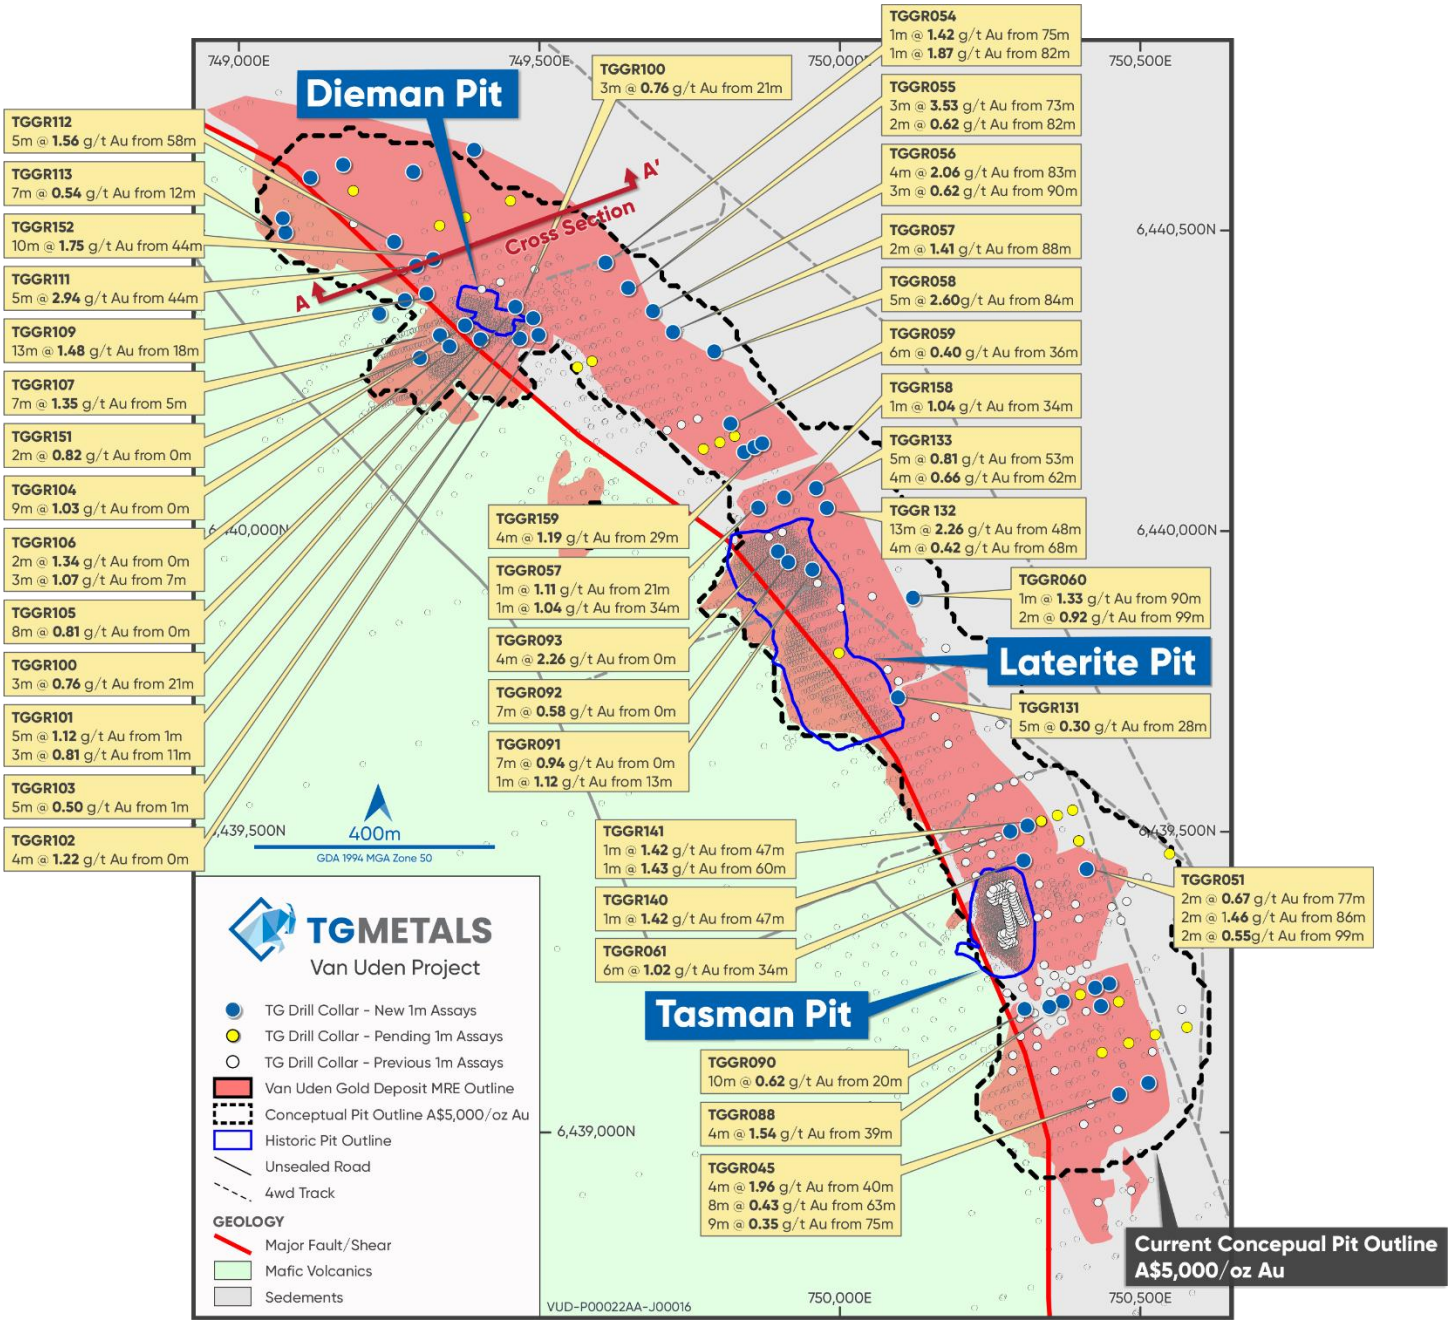

Figure 1 – New Resource Drilling Collars Showing Select Intercept Highlights (New Results in Yellow) and Pending Assay Drillholes marked yellow collars

Figure 2 shows a typical section through the new drilling in the northern area of Van Uden which identifies the follow-up drilling from the up-dip intercept of 6m @ 3.35g/t Au from 40m reported on 12 January 2026. New intercepts returned 5m @ 2.94 g/t Au from 44m and 10m @ 1.75 g/t Au from 44m. The gold mineralisation in this northern part of the deposit is flat dipping and hugging the basalt-sediments contact. These additional strong drill results provide greater confidence for up-dip extensions from further shallow drilling. The results so far are expected to push the conceptual pit shell deeper and further to the West.

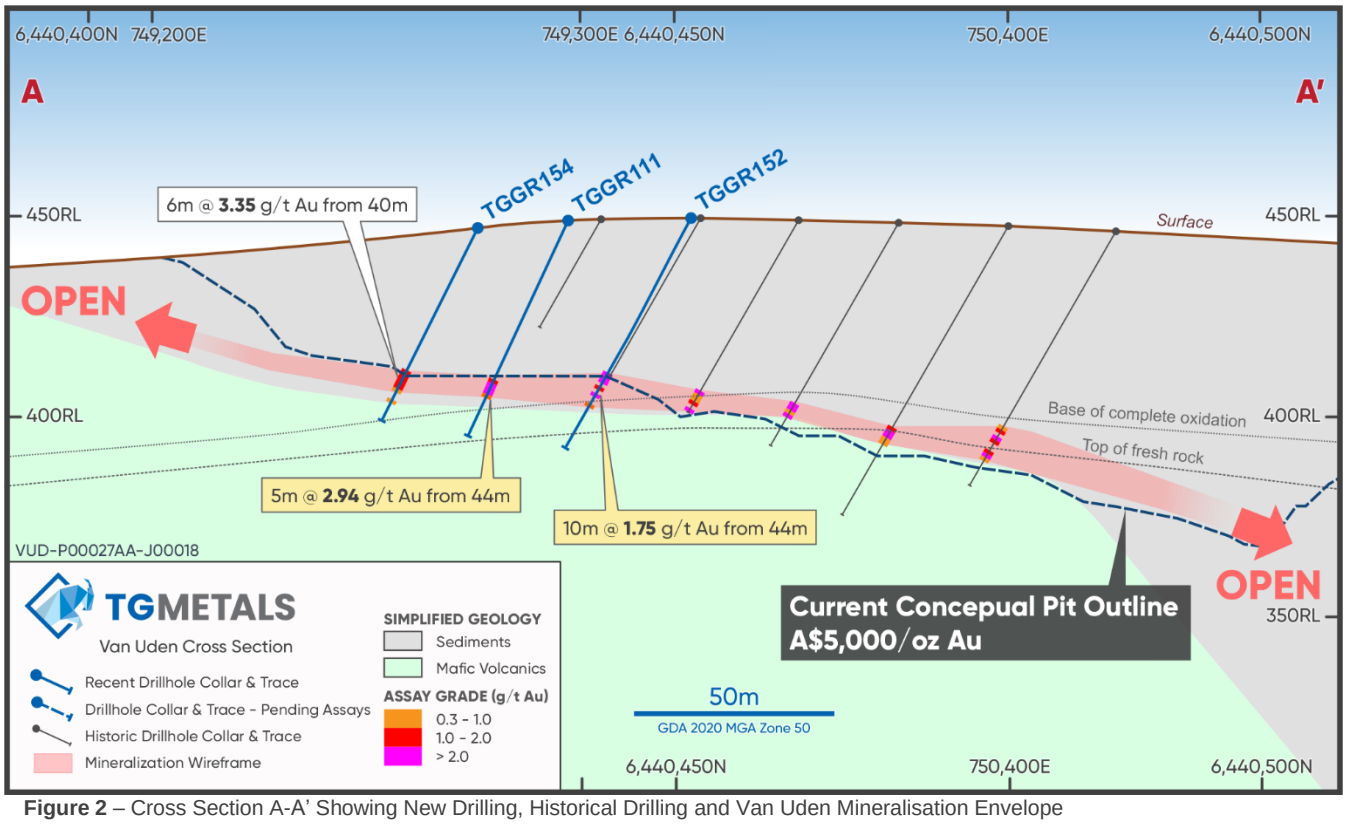

Figure 2 – Cross Section A-A' Showing New Drilling, Historical Drilling and Van Uden Mineralisation Envelope

Drillhole TGGR132 (Figure 1) was drilled between drill sections as a lone drillhole and intercepted 13m @ 2.26 g/t Au from 48m in the central-northern part of the Van Uden deposit. This intercept proves the continuity of this relatively thick zone of shallow gold mineralisation. The full significant assay results above 0.3g/t Au are provided in **Table 2**.

Several drillholes in new and extended positions intercepted mineralised laterite from surface and are expected to increase the laterite component of the current MRE. The laterite is currently being assessed for potential onsite treatment as the mining cost of surface laterite is not burdened with waste removal costs. Bulk samples have been acquired for metallurgical testing using site water.

Drilling Program Details

The RC drilling for this report was conducted with two drill rigs, both truck mounted. A Schramm X300 and a Schramm T660 drill rig. The smaller Schramm X300 rig completed the shallow drilling, less than 90m depth in the oxidised to semi-oxidised regolith and the deeper holes were completed with the larger Schramm T660 rig. A total of 52 drillholes with assays returned, are included in this report for 3,606m of RC drilling. The drillhole dips range between -90º (vertical) and -60º primarily at an azimuth of 250º (TGGR092 and TGGR093 are at azimuth 360º and vertical holes, azimuth zero) to align with the previous historical grid. See **Table 1** for drill collar information.

The reported drilling is right across the entire length of the current MRE. The drill collars of drillholes with pending assays are also included in this report and updated collar coordinates from DGPS field surveying using the MGA2020 Zone 50 grid and datum to align with DMPE requirements for government data submission. See **Figure 1** for drill collar locations.

Individual 1m samples in the known mineralised shear zone were taken and 4m composites taken outside of these zones. Both sample interval batches were assayed using the Photon assay technique. Where the 4m composites recorded anomalous gold, these samples were further analysed for the 1m split intervals. Many of these remain outstanding at the laboratory as at this report date and will be reported in future drilling updates as the 1m split assays come to hand. As experienced previously, several drillholes recorded multiple gold mineralised intercepts downhole, refer to **Table 2**.

Follow-up Work

Ongoing drilling results will be used to update the current resource model, MRE (Table A).

Mineralisation and geology interpolation is ongoing as logging and assay data becomes available.

First diamond drill core drilling has commenced on previous RC drillhole extensions and Geotechnical drillholes.

Pending assays will be reported as they come to hand in February 2026.

Further RC Drilling along strike and outside of the Van Uden MRE influence is being planned and further approvals sought.

Further drilling at the Gold City prospect will commence when approvals have been granted.

Soil sampling assays for Cronin West exploration tenement, Van Uden far north (Powerline Prospecting Licence) and Gold City infill are also expected to return from the laboratory in the coming weeks.

Van Uden Gold Project Description

The Project is located on the Forrestania Greenstone Belt, **Figure 3**, 90km east-northeast of Hyden and 120km south of Southern Cross. It is close to the Marvel Loch (producing) and Westonia - Edna May (care & maintenance) gold processing Plants. The Project lies 12.5km to the south west of the Mt Holland lithium mine and is 130km north west from the Company's established Burmeister lithium deposit at the Lake Johnston Project.

Van Uden Gold consists of an Indicated and Inferred Mineral Resource as per **Table A** below on four granted mining leases, four granted exploration licences, one exploration licence application and two miscellaneous licences (for haul roads).

Mineral Resource Estimate for the Van Uden Gold Deposit - May 2025									
Material	Indicated			Inferred			Total		
	Tonnes	Grade (Au g/t)	Gold (Oz)	Tonnes	Grade (Au g/t)	Gold (Oz)	Tonnes	Grade (Au g/t)	Gold (Oz)
Laterite	234,000	0.9	6,940	525,000	0.7	11,800	759,000	0.7	18,740
Oxide	867,000	1.2	34,200	1,141,000	1.0	38,200	2,008,000	1.0	72,400

Total	**1,710,000**	**1.2**	**68,340**	**4,643,000**	**1.2**	**158,800**	**6,353,000**	**1.1**	**227,140**

Table A: MRE – Van Uden Gold Deposit

The Mineral Resources statement conforms to the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code) 2012 Edition. All tonnages are dry metric tonnes. It has been reported at a cut-off grade of 0.35 g/t Au by area within a A$5,000/oz Au optimised pit shell based on mining parameters and operating costs typical for Australian open pit extraction deposits of a similar scale and geology. Minor discrepancies may occur due to rounding of appropriate significant figures.

The resources comply with the Reasonable Prospects for Eventual Economic Extraction (RPEEE), a key principle in mineral resource reporting that requires the qualified person to demonstrate that a mineral deposit has the potential to be economically extracted in the future.

About TG Metals

TG Metals is an ASX listed company focused on exploring and developing gold and lithium assets at its wholly owned Lake Johnston Project and 80% owned Van Uden Gold Project in the stable jurisdiction of Western Australia, **Figure 4**. The Lake Johnston Project hosts the Burmeister high grade lithium deposit, Jaegermeister lithium pegmatites and several surrounding lithium prospects. Burmeister is in proximity to four lithium processing plants and undeveloped deposits. The Van Uden Gold Project contains past producing gold mines and is in proximity to operating gold processing Plants.

Authorised for release by TG Metals Board of Directors.

Competent Person Statement

Information in this announcement that relates to exploration results, exploration strategy, exploration targets, geology, drilling and mineralisation is based on information compiled by Mr David Selfe who is a Fellow of the Australasian Institute of Mining and Metallurgy and an employee of TG Metals Limited. Mr Selfe has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activities that he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Selfe has consented to the inclusion in this report of matters based on their information in the form and context in which it appears. Mr Selfe considers that the information in this announcement is an accurate representation of the available data and studies for the Van Uden Gold Project.

Forward Looking Statements

This announcement may contain certain statements that may constitute “forward looking statements”. Such statements are only predictions and are subject to inherent risks and uncertainties, which could cause actual values, results, performance achievements to differ materially from those expressed, implied or projected in any forward looking statements.

Forward-looking statements are statements that are not historical facts. Words such as “expect(s)”, “feel(s)”, “believe(s)”, “will”, “may”, “anticipate(s)” and similar expressions are intended to identify forward-looking statements. These statements include, but are not limited to statements regarding future production, resources or reserves and exploration results. All such statements are subject to certain risks and uncertainties, many of which are difficult to predict and generally beyond the control of the Company, that could cause actual results to differ materially from those expressed in, or implied or projected by, the forward-looking information and statements. These risks and uncertainties include, but are not limited to: (i) those relating to the interpretation of drill results, the geology, grade and continuity of mineral deposits and conclusions of economic evaluations, (ii) risks relating to possible variations in reserves, grade, planned mining dilution and ore loss, or recovery rates and changes in project parameters as plans continue to be refined, (iii) the potential for delays in exploration or development activities or the completion of feasibility studies, (iv) risks related to commodity price and foreign exchange rate fluctuations, (v) risks related to failure to obtain adequate financing on a timely basis and on acceptable terms or delays in obtaining governmental approvals or in the completion of development or construction activities, and (vi) other risks and uncertainties related to the Company’s prospects, properties and business strategy. Our audience is cautioned not to place undue reliance on these forward-looking statements that speak only as of the date hereof, and we do not undertake any obligation to revise and disseminate forward-looking statements to reflect events or circumstances after the date hereof, or to reflect the occurrence of or non-occurrence of any events.

The Company believes that it has a reasonable basis for making the forward-looking Statements in the presentation based on the information contained in this and previous ASX announcements.

The Company is not aware of any new information or data that materially affects the information included in this ASX release, and the Company confirms that, to the best of its knowledge, all material assumptions and technical parameters underpinning the exploration results in this release continue to apply and have not materially changed.

JORC Code, 2012 Edition – Table 1

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• All holes were sampled at 1 m intervals using an on-board Ox Cyclone Sampling system with fixed cone splitter engineered for the rig. Samples outside of the known gold mineralised zones are composited to 4m samples and assayed prior to the 1m intervals being submitted for assay. 4m composite samples are not reported. • Two samples (Original + Duplicate) were collected each metre, representing 12.5 % of total cyclone discharge per split. • Certified reference materials (CRMs) were inserted every 20 samples, and coarse blanks every 40 samples. All samples were dry. • Samples were transported to Laboratory: SGS Australia Pty Ltd, Kalgoorlie WA (17 Stockyard Way) for PhotonAssay™ PAAU02, two-cycle analysis on 500g of crushed material.

Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• Reverse-circulation (RC) drilling was completed using two rigs for these reported results, selected to match depth requirements and operational efficiency
		• Impact Drilling – RIG 02
		  ○ Rig: Schramm T660 (8×8 MAN carrier)
		  ○ Year: 2006 (rebuilt 2021)
		  ○ Capability: High-capacity deep RC drilling
		  ○ Depth capacity: >500 m (4.5″ RC)
		  ○ Rod handling: KL rod handler
		• Impact Drilling – RIG 10
		  ○ Rig: Schramm X300 (4×4 MAN carrier)
		  ○ Year: 2006
		  ○ Capability: Shallow to moderate depth RC drilling
		  ○ Depth capacity: ~150 m

Criteria	JORC Code explanation	Commentary
		• Safety & control: KL rod handler, TJM hands-free breakout, rear-mounted controls, onboard dust collection and suppression.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• Sample recovery was visually assessed and recorded by comparing the two splitter outputs each metre. • All samples were dry with negligible loss. • Given the dry conditions and fixed splitter configuration, no material bias is expected.

Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.*
	•
	• *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.*
	• *The total length and percentage of the relevant intersections logged.*
		• RC drill cuttings of the metre intervals were sieved, washed and placed into a chip tray for geological logging and for future reference. Clay intervals in regolith were not sieved, however any remnant rock/hard material were sieved and washed for identification.
		• TG Metals Limited geological logging system:
		  ○ Recognises fresh rock vs regolith.
		  ○ Is both qualitative and quantitative.
		  ○ Industry and geological standards were followed recording every detail observed.
		  ○ Every interval (m) drilled was logged.
		  ○ 20m interval Chip trays were labelled and used to store a small representative sample for future reference.

Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.*
	• *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.*
	• *For all sample types, the nature, quality and appropriateness of the sample preparation technique.*
	• *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.*
	• *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.*
	• *Whether sample sizes are appropriate to the grain size of the material being sampled.*
		• Samples were split at the rig using a fixed cone splitter, producing two by 12.5 % sub-samples per metre.
		• All samples were transported to SGS Kalgoorlie for preparation and PhotonAssay™ analysis.
		• Laboratory preparation (SGS Kalgoorlie) included:
		  ○ Drying at 105 °C (< 3 kg) — G_DRY
		  ○ Crushing 90 % < 3.35 mm — G_CRU_KG
		  ○ 500g PhotonAssay™ jar filled from crushed material
		• Sample weights were recorded by SGS on receipt.
		• CRMs and blanks returned results within expected limits.
		• Field duplicates retained but not yet analysed.

Criteria	JORC Code explanation	Commentary
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• Laboratory: SGS Australia Pty Ltd, Kalgoorlie WA (17 Stockyard Way). • Method: PhotonAssay™ PAAU02, two-cycle analysis on crushed material. • Charge weight: 500g Detection limit: 0.03 ppm Au – 350 ppm Au (over-range PAAU02H, 100 – 3500 ppm Au). • Preparation: drying, crushing (90 % < 3.35 mm) prior to jar fill. • Precision may be reduced in samples with elevated U, Th or Ba. • No umpire analyses to date.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• All assays reviewed and verified internally by TG Metals geological personnel prior to import into the master database. • No twinned holes were drilled. However holes were drilled in proximity to historical drillholes for comparative and additional data.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• Coordinate system: MGA2020 Zone 50 for final hole DGPS surveys and MGA94z50 for all other field work • Collar survey: GPS (+/- 3m accuracy). DGPS at conclusion of the program • Downhole survey: CHAMPS north-seeking gyro (Continuous mode) – manufactured by Downhole Surveys Pty Ltd • Topography: LiDAR surface model.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• Spacing considered appropriate for the resource infill drilling campaign. • The drilling data will be used to update the current reported MRE (Table A of the report) • Assays reported on 1 m intervals; no compositing applied.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• Mineralisation is interpreted as shear- and vein-hosted along local contacts; drilling orientations are appropriate for testing mineralised zones and introduce no material bias at this scale.

Criteria	JORC Code explanation	Commentary
Sample security	• *The measures taken to ensure sample security.*	• Samples were bagged and sealed in calico bags inside polyweave sacks, cable-tied and labelled at the rig. • Chain of custody was maintained by TG Metals personnel, who personally transported samples directly from site to SGS Kalgoorlie Laboratory for registration and analysis.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• No external audits specific to this program. • Internal QAQC checks identified no material issues.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• All drilling is within in Mining Leases **77/477, M77/478 and M77/523.** The tenements are currently held by Montague Resources Pty Ltd (80%) and Barto Gold Mining Pty Ltd (20%). **Ownership:** TG Metals has acquired 80% ownership of the Mining lease from Montague Resources Australia Pty Ltd, pending title transfer. • The tenements are in good standing and unaffected by heritage or environmental encumbrances.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• Dieman, Laterite and Tasman Pits were previously mined and drilled by earlier operators as part of historic gold extraction. • Historic data have been reviewed where available.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• Orogenic, shear- and vein-hosted gold mineralisation occurs within the Forrestania greenstone belt along the sediment–mafic contact, which is mapped as the Van Uden Shear. Host rocks are amphibolite-facies metasediments and mafic volcanic units showing local quartz veining and minor schistose alteration. Gold mineralisation is structurally controlled and consistent with regional orogenic systems of the Western Australian Yilgarn Craton.

Criteria	JORC Code explanation	Commentary
		• Most gold mineralisation is formed withing the sediments, however where the mafic/sediment contact undulates, the gold mineralisation is known to occur within the mafic rocks.

Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:*
	  ○ *easting and northing of the drill hole collar*
	  ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar*
	  ○ *dip and azimuth of the hole*
	  ○ *down hole length and interception depth*
	  ○ *hole length.*
	• *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*
		• Collar coordinates, orientation and hole depths for the infill drilling have been provided in the Table 1 of the report.
		• No holes were abandoned.

Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.*
	• *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.*
	• *The assumptions used for any reporting of metal equivalent values should be clearly stated.*
		• Significant intercepts reported on length-weighted 1 m assays using the following criteria:
		  ○ Lower cut-off: 0.3g/t Au
		  ○ Minimum downhole width: 1 m
		  ○ Maximum internal dilution: 2 m
		  ○ No top-cut applied
		  ○ No metal equivalents used.

Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Intercepts represent downhole lengths • Mineralisation trends NNW and dips 45-50 degrees to the east. Dips are flatter to the north. • Most drill holes are drilled to azimuth 250 degrees (WSW) and at -60 degrees dip. • Some holes were drilled Vertical next to Nearby Infrastructure like open pit voids to allow the rig to get as close as possible. • Some holes were drilled towards 070 azi due to open pit void constraining ideal drill pad locations.

Criteria	JORC Code explanation	Commentary
		• The orientation of most of the drill holes is roughly perpendicular to the gold mineralisation, and down hole length are approximately equal to true width.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Maps, diagrams and sections have been included in the report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• All holes for which assays have been received and not previously reported from this program have been included in Table 2 (body text) to ensure balanced reporting.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Drilling was conducted to expand the current Van Uden MRE via infill, down dip and up dip directions. • No density or metallurgical data were collected.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• Refer to ‘Follow-up Work’ in the report. • See Figure 1 in the body text for future drilling areas and targets. Figure 3 in the body text shows the project tenements which includes future drilling targets.
