NW Array Drilling and Trenching Confirm Extensions to Gold Mineralisation

Felix Gold (ASX:FXG) is reporting drilling and trenching gold assay results from the Northwest Array at Treasure Creek. These results are from the drill program in a tightly focused, small-footprint target area designed to test the high-grade antimony mineralisation within the broader gold halo. The program supported the antimony strategy but also has confirmed strong gold mineralisation. Drilling within this zone has targeted the orientation and continuity of massive stibnite veins across multiple directions, as well as the north-northeast trending breccia unit. The program also supports waste rock characterisation and other relevant data required for near-term production studies. The dataset reflects the high density of drilling within a confined area. The initial step-out trenching approximately 130 metres west of the main target area has been completed, with those results also included here.

Key Highlights

High-Grade Gold Results

- Surface trench 25NWTR001 exposes **67m of gold mineralisation across 90m** (**26m @ 1.86 g/t Au**, including **12m @ 2.86 g/t Au)**— located 130m west of the main 2025 drilling area, extending the NW Array mineralised corridor into an area acquired by Felix in May 2024, confirming historical shallow air-track drilling results.
- Drill results from the main antimony target area continue to confirm the presence of broad zones of gold mineralisation forming halos around antimony vein zones.
- Gold assay results are pending for 44 diamond holes and 18 RC holes. Antimony/ multielement assay results are pending for a further 45 diamond holes and 6 RC holes.
- Best drill results include:
    - **47.36m @ 1.34 g/t Au** from 19.5m, including **7.8 m @ 1.79 g/t Au** from 29.24 m and including **7.09m @ 2.27 g/t Au** from 59.77m (Hole 25TCDC020)
    - **15.71m @ 2.91 g/t Au** from 37.61m, including 11.01m @ 3.87 g/t Au (Hole 25TCDC004)
    - **13.72m @ 2.83 g/t Au,** including **7.62m @ 4.45 g/t Au** from 27.43m (Hole 25TCRC003)
- Mineralisation remains open along strike and at depth.

Watch Now

Executive Director's Comment

Felix Gold's Executive Director, Joseph Webb, commented:

> *"Following our recent announcement of 47 metres at 2.45 g/t and 29 metres at 3.90 g/t gold from drilling, today's trenching results show the mineralised system extends at least 130 metres further west along strike — with 67 metres of gold mineralisation exposed across a 90-metre trench.* ***The system remains open in all directions.***
>
> *Gold built this company, however our immediate focus remains building America's first fully integrated antimony supply chain, from ore to metal, on U.S. soil. Our 831,000-ounce JORC gold resource represents significant strategic optionality that we continue to advance in parallel. Today's results reinforce the value embedded in our gold portfolio.*
>
> *NW Array hosts both commodities within the same structural corridor. Gold forms broader mineralisation halos around the antimony-bearing structures being targeted for near-term production. The infrastructure, permitting, and baseline studies serve both antimony and gold. The drilling generates data for the two commodities - one platform, complementary value creation.*
>
> *We are located 30 kilometres by road from Kinross Gold's Fort Knox mill which is a Tier 1 facility actively seeking additional ore under its Kinross Alaska strategy. With gold prices hitting all time high, the potential for a simple extraction strategy is high. We see great potential in the district which is why we are currently the largest landholder in the Fairbanks Gold Mining District ."*

Cautionary Statement: The Company cautions that it is assessing the economic viability of near-term antimony production. No Mineral Resources or Ore Reserves have been declared and no JORC-compliant economic studies have been completed. Any progression toward production remains subject to further technical, regulatory and commercial evaluation, permitting approvals and formal Board approval. The Company may elect to progress parts or all of the project prior to completion of such compliant studies. Statements regarding peer projects are based on the Company's review of publicly available information and the Company has not conducted an exhaustive review of all antimony projects globally.

A Premier Gold Mining District

Felix is the largest landholder in the Fairbanks Gold Mining District, with **831,000 oz of JORC gold resources** and significant exploration upside across >1500 km^2 (388,000+ acres) in Alaska's most productive gold region. The district has produced over 16 million ounces of gold historically and hosts Kinross Gold's Fort Knox mine — a Tier 1 operation located just 30km from NW Array by paved road. Established infrastructure, including grid power, year-round road access, skilled workforce, and proximity to processing facilities, provides a straightforward development pathway

(Fig 1). Kinross's Alaska strategy involves consolidating regional ore sources to feed the Fort Knox mill. Kinross is currently trucking ore 400km (250 miles) from Manh Choh, demonstrating willingness to source material from significant distances. NW Array's proximity - 30km versus 400km - represents a potential toll treatment pathway that could complement Felix Gold's immediate antimony focus.

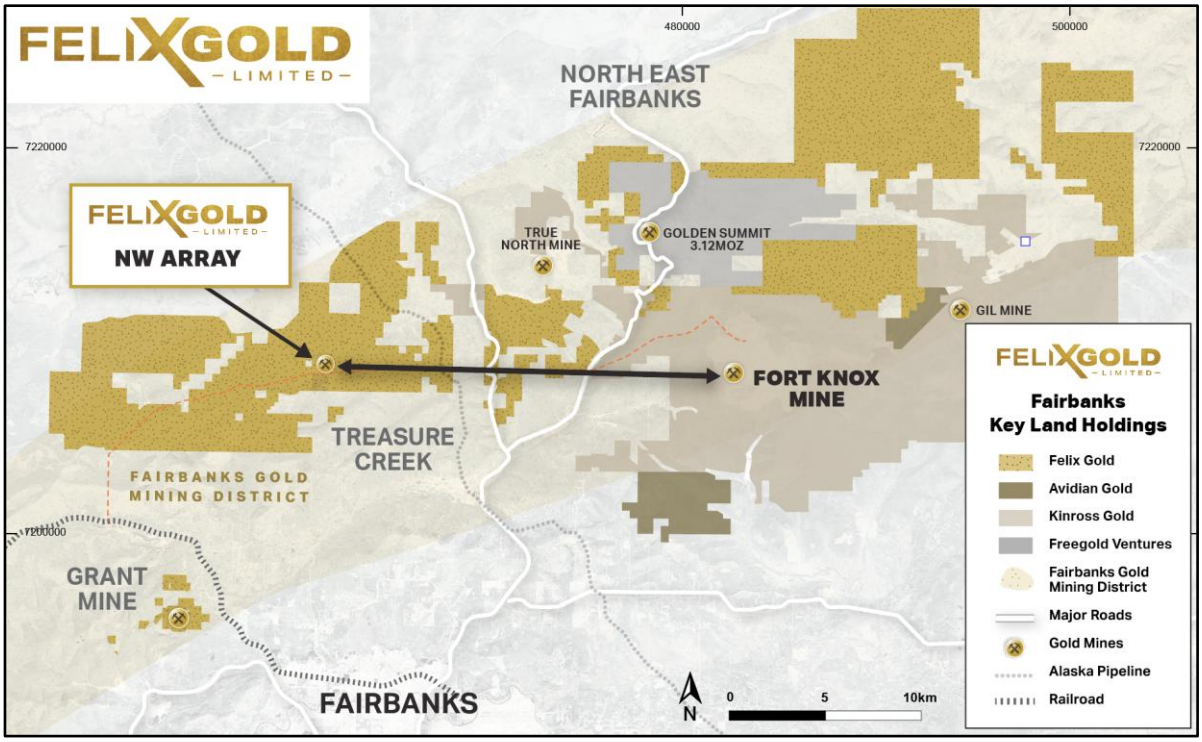

Fig 1. Location of reported gold results from NW Array, shown within the Fairbanks Gold Mining District

NW Array Prospect

The NW Array Prospect hosts both high-grade antimony and gold mineralisation within the same structural corridor. Gold generally forms a broad mineralisation halo, within which occur the antimony-bearing structures. The same geological system delivers value from the two commodities.

The prospect includes the historic Scrafford Mine, Alaska's second-largest historical antimony producer. Felix Gold's systematic exploration has defined multiple mineralised structures within an expanding footprint, with both gold and antimony mineralisation remaining open in multiple directions.

Gold Drilling Results — NW Array

Geological Setting and Interpretation

The NW Array prospect hosts both high-grade antimony and gold mineralisation within the same structural corridor. Gold generally forms a broader mineralisation halo, within which occur the antimony-bearing structures, particularly in brecciated zones.

Drilling and trenching have revealed two main styles of mineralisation:

- **East-west trending vein zones** — individual veins or close-spaced zones of veining, fracturing, and brecciation with quartz fill, dipping approximately 60-70° towards the south to south-southwest
- **"Black breccia" zones** — broader mineralised fault structures with angular clasts of silicified wallrock and fine-grained disseminations, dipping approximately 50° towards the southeast to east

High gold grades are commonly associated with these brecciated zones and correspond with antimony-bearing structures. The Sb-enriched mineralised system extends over an area approximately 200 metres by 125 metres to depths exceeding 150 metres vertically, and remains open along strike and at depth.

Surface Trenching Results

Trench 25NWTR001 is located approximately 130 metres west of the southern end of the main drilling area which targeted antimony veining, and was designed to confirm high-grade gold results from historical shallow air-track drill holes with a best intersection of 12m @ 1.7 g/t Au. The area was acquired by Felix in mid-2024 and was not trenched during earlier programs in 2022-2023. The current 90-metre trench exposed a total of 67 metres of >0.3 g/t gold, extending the structural corridor hosting mineralisation significantly beyond the current drill-tested area.

The highest grade intersections in trench 001 from 46m to 72m of 1.86 g/t Au and from 75m to 82m of 1.3 g/t Au are related to a fault breccia developed at the contact between felsic porphyry to the west and schist to the east. The breccia zone is mapped dipping approximately 30° to the east, striking north with a true thickness of approximately 10m. The maximum grade over 1m of 8.27 g/t Au occurs near the western end of this zone close to the contact with porphyry. Three lower-grade zones between 0m and 36m (<1 g/t Au on average) are within silicified and fractured felsic porphyry with minor disseminated sulphides. Antimony grades within the trench are mostly less than 0.1% Sb, despite having some poddy stibnite observed within the fault breccia zone. A few samples returned Sb grades between 0.3% and 0.5%, from fractured felsic porphyry and fault breccia.

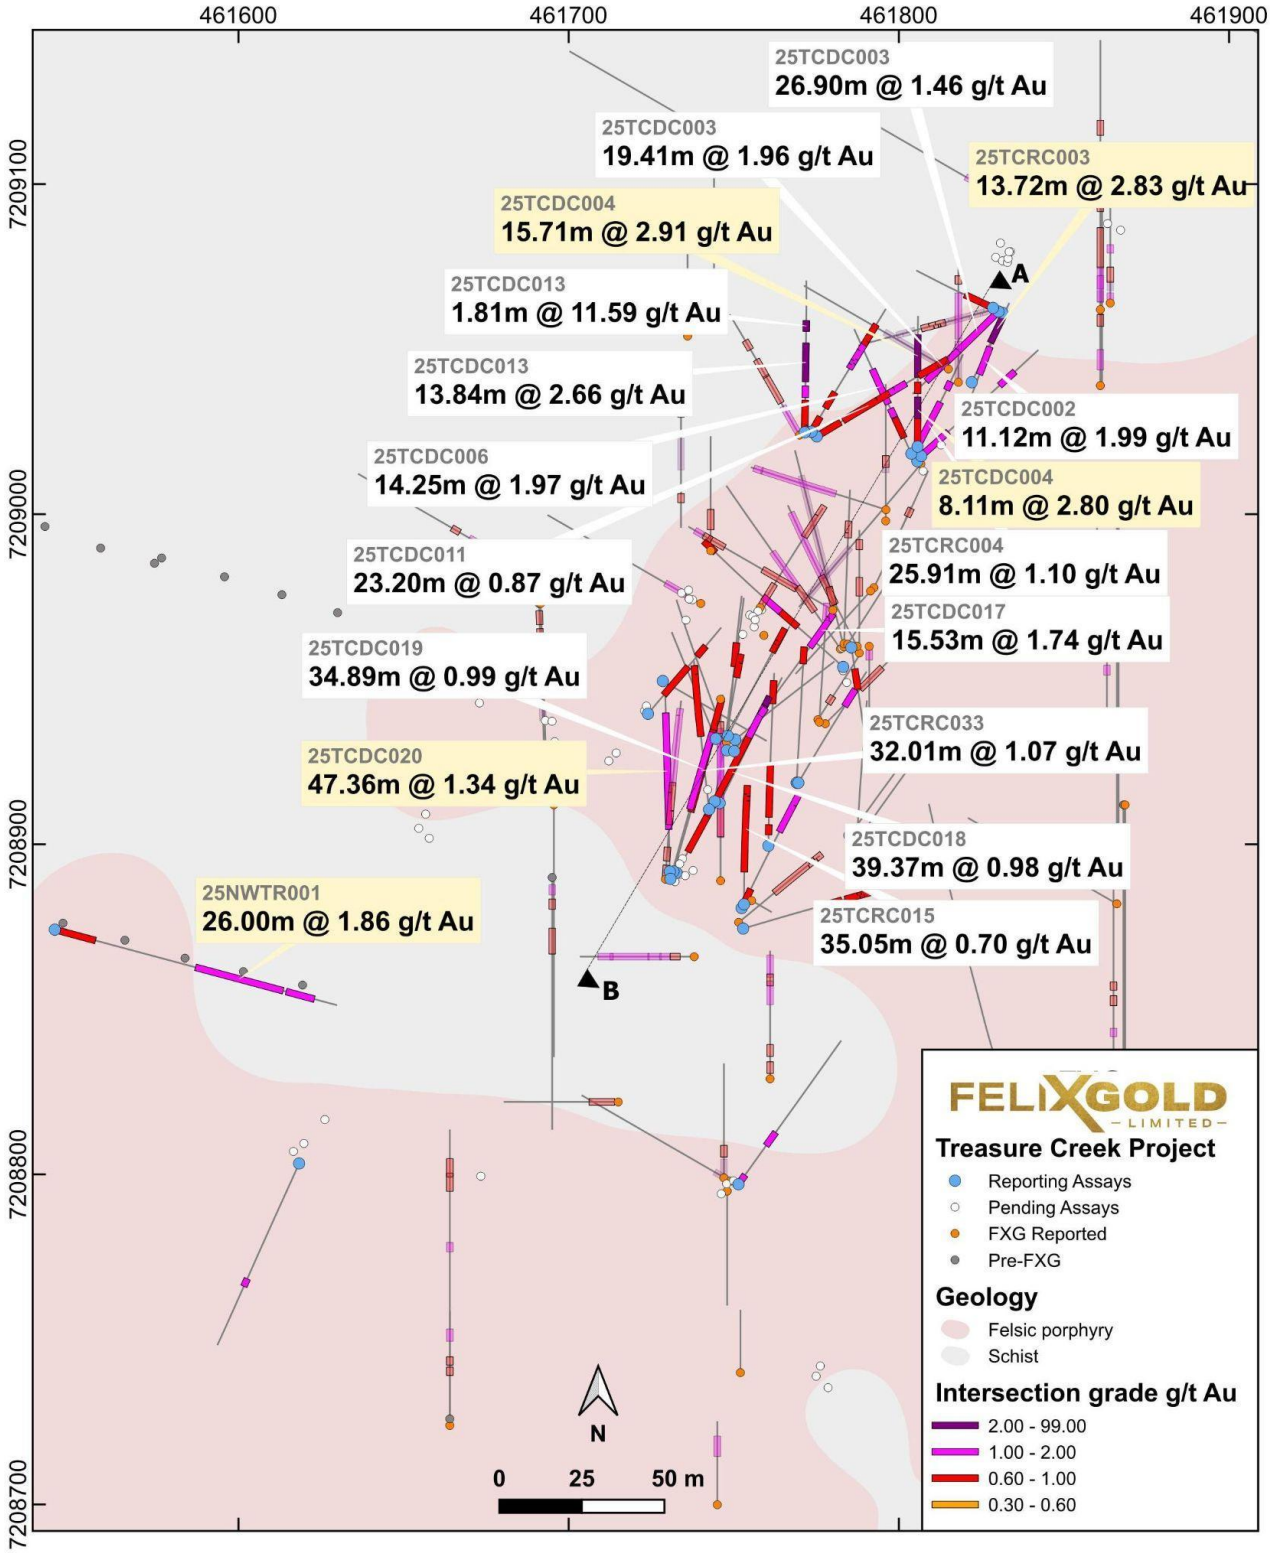

Fig 2. NW Array Prospect — Selected best intersections from new gold assay results coloured by average intersection grade. Previously reported intersections in lighter colours. Note location of trench 25NWTR001 130m west of southern edge of main drilling area targeting antimony veining.

Drilling Results

The latest gold assay results from a total of 39 drill holes provide further insights into the geometry and extents of bulk low-grade and high-grade gold mineralisation within the area covered by close spaced drilling targeting narrow antimony veins. The “black breccia” zones that contain antimony mineralisation are confirmed as high-grade gold structures dipping moderately east to south-east, parallel to the western contact of schist and felsic porphyry. Higher gold grades also occur within east to east-southeast trending zones contained within a north-northeast trending corridor.

Black breccia intersections with high-grade gold assays include diamond holes 25TCDC003 (19.41m @ 1.96 g/t Au from 30.82m), 25TCDC004 (15.71m @ 2.91 g/t Au from 37.61m) and 25TCDC020 (7.09m @ 2.27 g/t Au from 59.77m).

Many of the other significant intersections are related to zones of fractured and silicified felsic porphyry with local clay-altered breccia zones and common iron oxides on fractures. The best results in 25TCDC018 of 39.37m @ 0.98 g/t Au from 29.2m and 25TCDC019 of 34.89m @ 0.99 g/t Au from 27.5m are related to this style of mineralisation. Some of these zones of altered felsic are also associated with antimony veining (for example 25TCDC004 8.11m @ 2.8 g/t Au from 18m), although the latter can also occur without significant gold mineralisation.

Outside the felsic porphyry and black breccia zones there are also some intersections related to fault zones wholly within schist, some of which can locally contain high grades. Hole 25TCDC013 contains two such zones: 13.84m @ 2.66 g/t Au from 23.07m and 1.18m @ 11.59 g/t Au from 44.85m.

Interpretation of results is ongoing, but there is an emerging picture of a mineralised corridor trending north-northeast along the western contact of felsic porphyry and schist. Within this north-northeast trending envelope there are zones trending east to east-northeast that are associated with gold and antimony mineralisation.

Further Results Pending

To date, out of 67 diamond holes (5,858m) and 56 RC holes (3,077m) drilled at NW Array, antimony/multielement assay results are pending for 45 diamond holes and 6 RC holes. Gold assay results are pending for 44 diamond holes and 18 RC holes.

About Felix Gold

Felix Gold Limited (ASX: FXG) is advancing two complementary opportunities in Alaska's Fairbanks Mining District: near-term antimony production and district-scale gold.

Antimony: Felix Gold is building America's Antimony Solution — a fully integrated domestic supply chain from proven U.S. ore. The Treasure Creek Antimony Project hosts one of the only proven sources of high-grade antimony ore in the United States. With ~90% antimony-bearing minerals and virtually no deleterious elements, Felix Gold has demonstrated military-grade antimony concentrate and 98% extraction — results that, to the Company's knowledge, no other Western project has publicly achieved.

Gold: Felix Gold is the largest landholder in the Fairbanks Mining District, with 831,000 oz of JORC gold resources located 30km from Kinross's Fort Knox mill — a Tier 1 operation actively seeking third-party ore.

The same infrastructure, permitting pathway, and team serve both commodities. Mineralisation outcrops at surface adjacent to year-round paved road with grid power, just 30km from Fairbanks. No federal land significantly reduces permitting timeframes compared to other U.S. critical minerals projects.

Visit www.felixgold.com.au for more information.

Competent Person Statements

The information in this report that relates to Exploration Results is based on, and fairly represents, information compiled by Dr James Lally, a Competent Person who is a Member of The Australian Institute of Geoscientists. Dr Lally is an independent consultant to Felix Gold Limited and is a shareholder in the Company. Dr Lally has sufficient experience, which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which is being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves.' Dr Lally consents to the inclusion in this report of the matters based on his information in the form and context in which it appears.

Forward-Looking Statements

Various statements in this release constitute statements relating to intentions, future acts and events. Such statements are generally classified as "forward-looking statements" and involve known and unknown risks, uncertainties and other important factors that could cause those future acts, events and circumstances to differ materially from what is presented or implicitly portrayed herein. Words such as "anticipates", "expects", "intends", "plans", "believes", "seeks", "estimates", "may", "potential", "pathway", "aims", "targeting" and similar expressions are intended to identify forward-looking statements. Forward-looking statements in this announcement include references to potential third-party processing or toll treatment arrangements for gold, future exploration programs and their anticipated outcomes, and infrastructure advantages and development potential. With respect to gold development specifically: no feasibility study has been completed, no commercial agreements exist with third parties for ore processing, and there is no certainty that any toll treatment arrangement will be achieved. Felix cautions shareholders and prospective shareholders not to place undue reliance on these forward-looking statements and references to what events have transpired for other entities, which reflect the view of Felix only as of the date of this release. The forward-looking statements made in this release relate only to events as of the date on which the statements are made. Various statements in this release may also be based on the circumstances of other entities. Felix gives no assurance that the anticipated results, performance or achievements expressed or implied in those statements will be achieved.

Previous Disclosure – 2012 JORC Code

The information in this release that relates to Exploration Results, Mineral Resources and Exploration Targets for Felix's Fairbanks Gold Projects was extracted from the following ASX Announcements:

29 Jan 2026 FXG: Drilling Confirms Broad Zones of Gold Mineralisation at Treasure Creek
27 Jan 2025 FXG: Antimony Metal Production Program Commences
25 Nov 2025 FXG: Shallow High-grade Gold Results at Treasure Creek
23 Jan 2025 FXG: High-grade Antimony and Gold Results from Trenching
20 June 2024 FXG: Maiden NW Array Inferred Mineral Resource
16 May 2024 FXG: Felix Gold Secures Strategic Claims, Expanding Scale Potential of NW Array Gold Trend
10 Apr 2024 FXG: North West Array Bottle Roll Gold Recoveries Average 90%
19 Oct 2023 FXG: High Grade Antimony Assays up to 28% Sb
11 Aug 2023 FXG: Assay Results Unveiling Substantial Gold Zones with Continued High-Grade Antimony Enrichment
24 July 2023 FXG: Continuation of Broad Zones of Gold and High-Grade Stibnite from NW Array
17 July 2023 FXG: High-Grade Critical Mineral Discovery at NW Array
04 July 2023 FXG: NW Array Drilling Announcement
03 July 2023 FXG: NW Array Drilling Returns Broad Gold Intercepts
30 May 2023 FXG: Drilling Commenced at NW Array
14 Mar 2023 FXG: Exploration Target for NW Array
03 Feb 2023 FXG: Deeper Gold Mineralization and Prospective Feeder Zones Discovered
19 Jan 2023 FXG: New Gold Zones Identified in Reconnaissance Drilling
09 Dec 2022 FXG: Scrafford Shear Potential Grows and High-Grade Antimony Initiatives Commenced
01 Dec 2022 FXG: Near-Surface Gold Zones Extended into Northern Treasure Creek
18 Oct 2022 FXG: Significant Expansion of NW Array Gold Zone
05 Oct 2022 FXG: 400M Traverse of Thick Gold Mineralisation Open
01 Aug 2022 FXG: Multiple Thick, Near-Surface Intercepts at Treasure Creek
22 Jun 2022 FXG: Step-out Drilling Success at Treasure Creek
28 Jan 2022 FXG: Felix Gold Prospectus

A copy of such announcements is available to view on the Felix Gold Limited website felixgold.com.au/announcements. **These previous reports were issued in accordance with the 2012 Edition of the JORC Code.** The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcement.

APPENDIX: JORC Code Table 1 Report

Section 1: Sampling Techniques and Data

Criteria	Explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as downhole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems.* • *Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• Trenches were excavated using a mechanical excavator to a depth of 1.5 metres. Samples were collected along 1 metre horizontal lengths by chipping the exposed area along the trench wall about 0.75m above the floor with a geological hammer. Polyweave bags were placed under the sampling interval to collect sample debris and to avoid contamination with other material. Sample weights varied between 2.5kg and 5kg. • Reverse Circulation drilling was sampled on 1.52 m (5 feet) intervals from which 5-6kg was split and pulverised / crushed to produce samples for ICP multi-element analysis, high grade Sb analysis and gold analysis by PhotonAssay™ • Diamond drill core was sampled over downhole lengths between 0.3m and 2.5m (average 1m) to produce samples for ICP multi-element analysis, high grade Sb analysis and gold analysis by PhotonAssay™ . Diamond drill-core sample intervals were adjusted based on changes in geology.

Criteria	Explanation	Commentary
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face- sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• Reverse Circulation (RC) holes were drilled with a 76mm (3 inch) face-sampling hammer with 73mm (2.875 inch) drill rods and 102mm (4 inch) casing. • Diamond holes were wireline HQ (63.5mm diameter) holes. • The diamond drill program reported here was undertaken by C-n-C Drilling LLC utilizing CS 14 skid mounted drill. • Core was oriented wherever possible for collection of structural data using a Reflex ACTIII • The core was reconstructed into continuous runs on a cradle for orientation marking before it was laid in the box at the drill.

Criteria	Explanation	Commentary
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• RC samples were visually assessed for recovery and were considered representative of bedrock intersected. • For several RC holes the first (and sometimes second) samples had insufficient recoveries from the splitter to provide enough material for a photonassay analysis. • Visual inspection of samples estimated no significant loss of sample from each 1.52m interval. • No relationship between sample recovery and reported analyses has been established. • Diamond core recovery was determined by measuring the total length of core in the barrel over the run length. • Hole depths were checked against the drillers core blocks at the time of processing. Inconsistencies between the logging and the driller's depth measurement blocks were investigated. • Diamond core samples are considered dry. The recovery and condition are recorded between every core block. Generally, recovery is 98-100% but on very rare occasions in weathered material or very broken material, recovery was down to 50%. • For Diamond drilling, contractors adjust the rate of drilling and method of recovery issues arise • No significant sample loss or bias has been noticed

Criteria	Explanation	Commentary
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• Qualitative logging of RC chips and diamond core for lithology and alteration with semi-quantitative logs for oxide and sulphide mineralisation. • RC and diamond holes were logged in for their entire lengths. • Logging detail is sufficient to support geological modelling and mineral resource estimation. • Representative RC chip samples from each 1.52m interval were placed in chip trays and photographed. • All drill core was photographed wet using a digital camera and stored on the site server. • Core logging included RQD and geotechnical measurements. Structural measurements of veins, fractures and foliation were taken from core using a strip protractor.

Criteria	Explanation	Commentary
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• Trench samples were submitted in their entirety to the laboratory with no further sub-sampling. • RC intervals were sub-sampled using a 3-tier dry sample splitter attached to the drill rig cyclone. Two samples were taken from each 1.52 m interval, collecting ~12.5% each of the total sample, ranging in weight from 2-3 kg. One sample was retained for archival purposes while the other was sent to the analytical laboratory. • Diamond core sampling intervals were determined by the logging geologist, with sampling breaks at major changes in lithology/alteration or mineralisation. Sub-samples were taken by sawing the HQ core in half along its axis using a Dewalt tile saw on-site. One half of the core was bagged for analysis and the other half retained in the core tray. • Sample sizes for RC and core samples are considered appropriate for both gold and antimony mineralisation. • Quality control procedures for ensuring sample representivity in RC sampling comprised the use of field duplicates and pulp duplicates at a rate of 1 in 20, alternating between the two duplicate types. • Quality control procedures for ensuring sample representivity in core sampling comprised the use of coarse crush duplicate splits from half core samples and pulp duplicates at a rate of 1 in 20, alternating between the two duplicate types. • Duplicate results show that for RC and diamond drilling sampling is representative for antimony, with variability in results linked to assay methods rather than sampling (see below).

Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• All samples were submitted to MSA Laboratories in Vancouver, Canada for analysis. • Gold was analysed using the PhotonAssay technique (MSA labs CPAu-1D method code). Two splits of approximately 500g of crushed material (70% passing 2mm) are taken from the sub-sample submitted to the laboratory using a riffle splitter. Both splits are subjected to high-intensity X-rays and the resulting gamma radiation emissions are detected and used to determine gold concentration in the sample. • For some very low-volume RC sub-samples at the hole collar there was insufficient material to provide the 500g required for photonassay. These are marked in appendix 2 as “insufficient sample”. • Analysis of split pair samples shows very good correlation with only three outlier values that have yet to be explained. • PhotonAssay results include quality flags for some samples that were reviewed by the CP: ○ HB (High Background): Indicates elevated background radiation detected during measurement, primarily affecting samples <0.1 ppm Au. Multi-element data shows Ba, U, and Th levels are generally low. ○ HET (Heterogeneous): Indicates high within-sample variability based on multiple readings at different angles. Less than 0.1% of analyses (8 samples) were flagged with HET and of these only 3 samples showed a significant difference between duplicate pairs • 5% of samples submitted for PhotonAssay are being cross-checked by screen fire assay at the same laboratory. No results for screen fore assays are available as yet. • 4 acid digest with ICP-MS finish was used to analyse for a full suite of trace elements: Ag, Al, As, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, Re, S, Sb, Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zn, Zr.

Criteria	Explanation	Commentary
		• 4-Acid ICP-MS has an upper detection limit (UDL) of 1% for antimony. Suspected very high-grade (>10% Sb) samples were flagged in sample submission sheets and analysed using a wet titration method. Samples not flagged as high grade, but which returned above UDL assays for ICP were re-analysed using a peroxide fusion with ICP finish. The cut-off ICP Sb assay for re-analysis by peroxide fusion was changed to 3000ppm after results indicated that volatile loss and insoluble precipitate formation was causing some ICP results to severely under-call the Sb grade. • Quality control procedures include the insertion of certified reference materials, coarse blanks (locally sourced sand) and field and pulp duplicates. Acceptable levels of accuracy and precision have been established, notwithstanding the issues with some Sb analyses described above
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• A senior manager verifies all significant and anomalous intersections during the drill hole validation process. • All primary data was collected in the field by Felix Gold contract staff and supplied in digital format to Felix Gold. • No twinned holes were drilled for this data set. • All data is stored and validated within a Plexer relational database managed by Gad Solutions in Brisbane, Australia. Data undergoes QA/QC validation prior to being accepted and loaded in the database. Assay results are merged when received electronically from the laboratory. A senior geologist reviews the dataset checking for the correct merging of results and that all data has been received and entered. Any adjustments to this data are recorded permanently in the database. Digital records of assays are stored electronically. • No adjustments have been made to the final assay data reported by the laboratory

Criteria	Explanation	Commentary
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• RC and diamond hole collar locations are initially located by handheld GPS to an accuracy of 3m. • After completion of drilling, all drill collars are located with a differential GPS system to an accuracy of 10 cm. • Locations are given in NAD83/UTM Zone 6N projection. • Diagrams and location table are provided in the report. • Topographic control is by detailed airphoto, DTM file, and differential GPD • Downhole surveys were conducted using an Axis Champ north-seeking gyro tool which collected data points approximately every 3 m downhole. • True north azimuths supplied from the gyro were corrected to UTM grid north.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• Variable drill hole spacings were used to adequately test targets and are determined from geochemical, geophysical and geological data with historical drilling information. • Data spacing is sufficient to establish geological and grade continuity to a level appropriate for a future update of the current gold-only mineral resource estimate at NW Array with addition of antimony • Reported intersections have been composited using a cut-off grade of 0.3 g/t Au.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• Drill holes are oriented at various angles to mineralised structures, in part due to access restrictions for drill pad locations and also due to the interpreted difference in strike and dip of the main mineralised structures. • Although individual holes may not be oriented optimally for sampling some structures, there is no overall sampling bias introduced.

Criteria	Explanation	Commentary
Sample security	• *The measures taken to ensure sample security.*	• Samples were collected by company personnel on site, to the company logging and cutting office and delivered direct to the preparation laboratory via company personnel. A transport contractor takes the prepared samples to Vancouver.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• No audits or reviews have been completed at this early stage of the drilling program.

Section 2: Reporting of Exploration Results

Criteria	Explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a license to operate in the area.*	• The Treasure Creek Project is located in the Fairbanks Gold Mining District in central Alaska. • The Treasure Creek Project area consists of 238 active Alaska State Mining Claims (MCs) and 2 Upland Mining Leases (UMLs) for a total of 11687.31 hectares. There are also 4 pending MCs for a total of 64.75 hectares. • The Treasure Creek Project is a consolidation of mining claims and upland mining leases held by Oro Grande Mining Claims LLC (10 MCs and 1 UML), Goldstone Resources LLC (19 MCs and 1 UML), Wally Trudeau (5 MCs), and Felix Gold Ltd (204 MCs). • Felix has acquired the mining claims or the exclusive rights to explore and an option to purchase the mining claims. • Felix has acquired all requisite operating permits to conduct the current exploration program.

Criteria	Explanation	Commentary
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• Gold was first discovered at Fairbanks in 1902, since then the wider area has been the subject of an enormous amount of exploration and placer mining by companies and individual prospectors. • Since 1969, the Treasure Creek area has been explored by companies including Cantu Minerals, Mohawk Oil, Aalenian Resources/Silverado Mines, American Copper and Nickel Company (ACNC), Amax, Goldstone/Our Creek (OCMC), Canex Resources, Tri-Con Mining and BHP-Utah. • Most of the work was focused on Au-Sb mines at and around Scrafford, and in the eastern third of Felix's current tenure. Several diamond holes were completed in the NW Array prospect area.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• Hard-rock gold mineralisation styles in Felix's Treasure Creek prospect are currently dominated by shear- and fault-vein hosted gold ± antimony deposits, including historic mines at Scrafford (Sb). Broad zones of disseminated and stockwork gold mineralisation are also found within Cretaceous age intrusive rocks, such as at Fort Knox (operated by Kinross) and Golden Summit (Freegold Ventures). • Gold mineralisation is linked to a causative intrusion of Cretaceous-Tertiary felsic to intermediated composition. Proximity to the intrusion, structural setting and host rock all control the specific style of deposit produced. Antimony mineralisation is also associated with these felsic sill-like bodies. • Post-mineralisation cover in the Fairbanks area comprises valley-fill gravels plus locally thick accumulations of wind-blown silt (loess).

Criteria	Explanation	Commentary
Drill hole information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* • *easting and northing of the drill hole collar* • *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* • *dip and azimuth of the hole* • *down hole length and interception depth hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• Refer to the body of the text of the announcement for all drill hole information relating to this announcement. • Details of any other drill holes referred to can be found in previous announcements listed under "Previous Disclosure - JORC 2012 Code". • No material information has been excluded.
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	•Significant Gold intercepts are regarded as those having minimum continuous mineralisation of at least 3.0m @ >0.3 g/t Au. Assays were aggregated by length-weighted averaging with no top-cutting applied. •Higher-grade inclusions within intersections used a cut-off of 1 g/t Au •A maximum of 3m total of internal waste with 3m consecutive waste intervals was allowed during economic compositing. No metal equivalents have been reported.

Criteria	Explanation	Commentary
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• All intercepts quoted are downhole widths. • The geometry of mineralisation with respect to the hole angle varies due to the wide range of drilling azimuths and variable strike and dip of mineralised zones. Modelling is ongoing to determine the true thickness of different gold mineralised zones. • Where core drilling has intersected structures with discernable orientations the estimated true widths are indicated in Table • Further drill results should verify the orientations of mineralisation as presented in this announcement.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Refer to figures in the body of the text.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• Gold plus previously reported antimony and arsenic assays for all samples in the reported drill holes are included as an appendix to this announcement.

Criteria	Explanation	Commentary
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Trenching completed earlier this year and in 2024 confirmed the presence of east-striking and south-dipping zones of complex stibnite veining that vary in width and tenor over short strike lengths. • A maiden Mineral Resource estimate was reported on 20th June 2024 for gold mineralisation at NW Array (FXG announcement 20 June 2024). Antimony was not included in the estimate due to lack of assay data • Metallurgical testwork on bulk samples was completed earlier in 2025 on bulk samples from trenching (FXG Announcement 29 May 2025). Testwork achieved 85% Sb recovery, producing 69% Sb grade concentrates via gravity and flotation processes. • Bulk density has been determined by the water immersion method on drill core samples, giving a density for porphyry of 2.59 g/cm3 and schist of 2.7 g/cm3. • Additional density measurements on drill core samples are being undertaken. • Four water monitoring bore holes were drilled as part of the 2025 drilling program and data on groundwater levels has been collected over 2 quarters.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• The 2025 drill program at NW array is ongoing, mainly targeted at better definition of the known mineralised zones, in particular the high-grade “black breccia” • The mineralised system remains open at depth and along strike to the north and south.

Appendix: Complete Assay Data
