North Kalgoorlie Hub, WA – Drilling Update

Multiple high-grade gold intercepts confirm significant growth potential at Comet Vale

- **Growth drilling** at the Comet Vale Gold Project in WA (part of the **1.2Moz @ 3.7g/t Au North Kalgoorlie Hub**) has intersected further **high-grade mineralisation at the cornerstone Sovereign Deposit:**
  - **10.6m @ 7.1g/t Au from 353.0m** in **STEX148**
  - **1.1m @ 60.2g/t Au from 260.5m** in **STEX135**
  - **2.2m @ 16.2g/t Au from 290.8m** in **STEX146**
  - **3.2m @ 11.3g/t Au from 279.8m** in **STEX140**
  - **1.9m @ 12.7g/t Au from 285m** in **STEX142**
  - **0.7m @ 9.2g/t Au from 254.8m** in **STEX141**
  - **0.7m @ 10.8g/t Au from 280.4m** in **STEX141**
  - **2.7m @ 5.6g/t Au from 290.2m** in **STEX143**
  - **4.0m @ 2.9g/t Au from 53.0m** in **STEX148**
- In 2025, **Gorilla Gold added 1.3Moz** in new **resources** across its WA projects by **drilling** new **targets**.
- **Five drill rigs are currently operating across the North Kalgoorlie Hub** as part of a program to **rapidly grow** Gorilla's **high-grade resource** base and underpin future studies.
- **Drilling is also underway at the Vivien Project with one drill rig,** targeting new high-grade discoveries.

Gorilla Gold Mines Ltd ('Gorilla', 'GG8' or 'the Company'), is pleased to report significant new drilling results from its 100%-owned Comet Vale Gold Project, located 100km north of Kalgoorlie in WA. The Comet Vale Project is part of the North Kalgoorlie Hub, which currently hosts 1.2Moz @ 3.7g/t Au and is expanding rapidly with ongoing drilling.

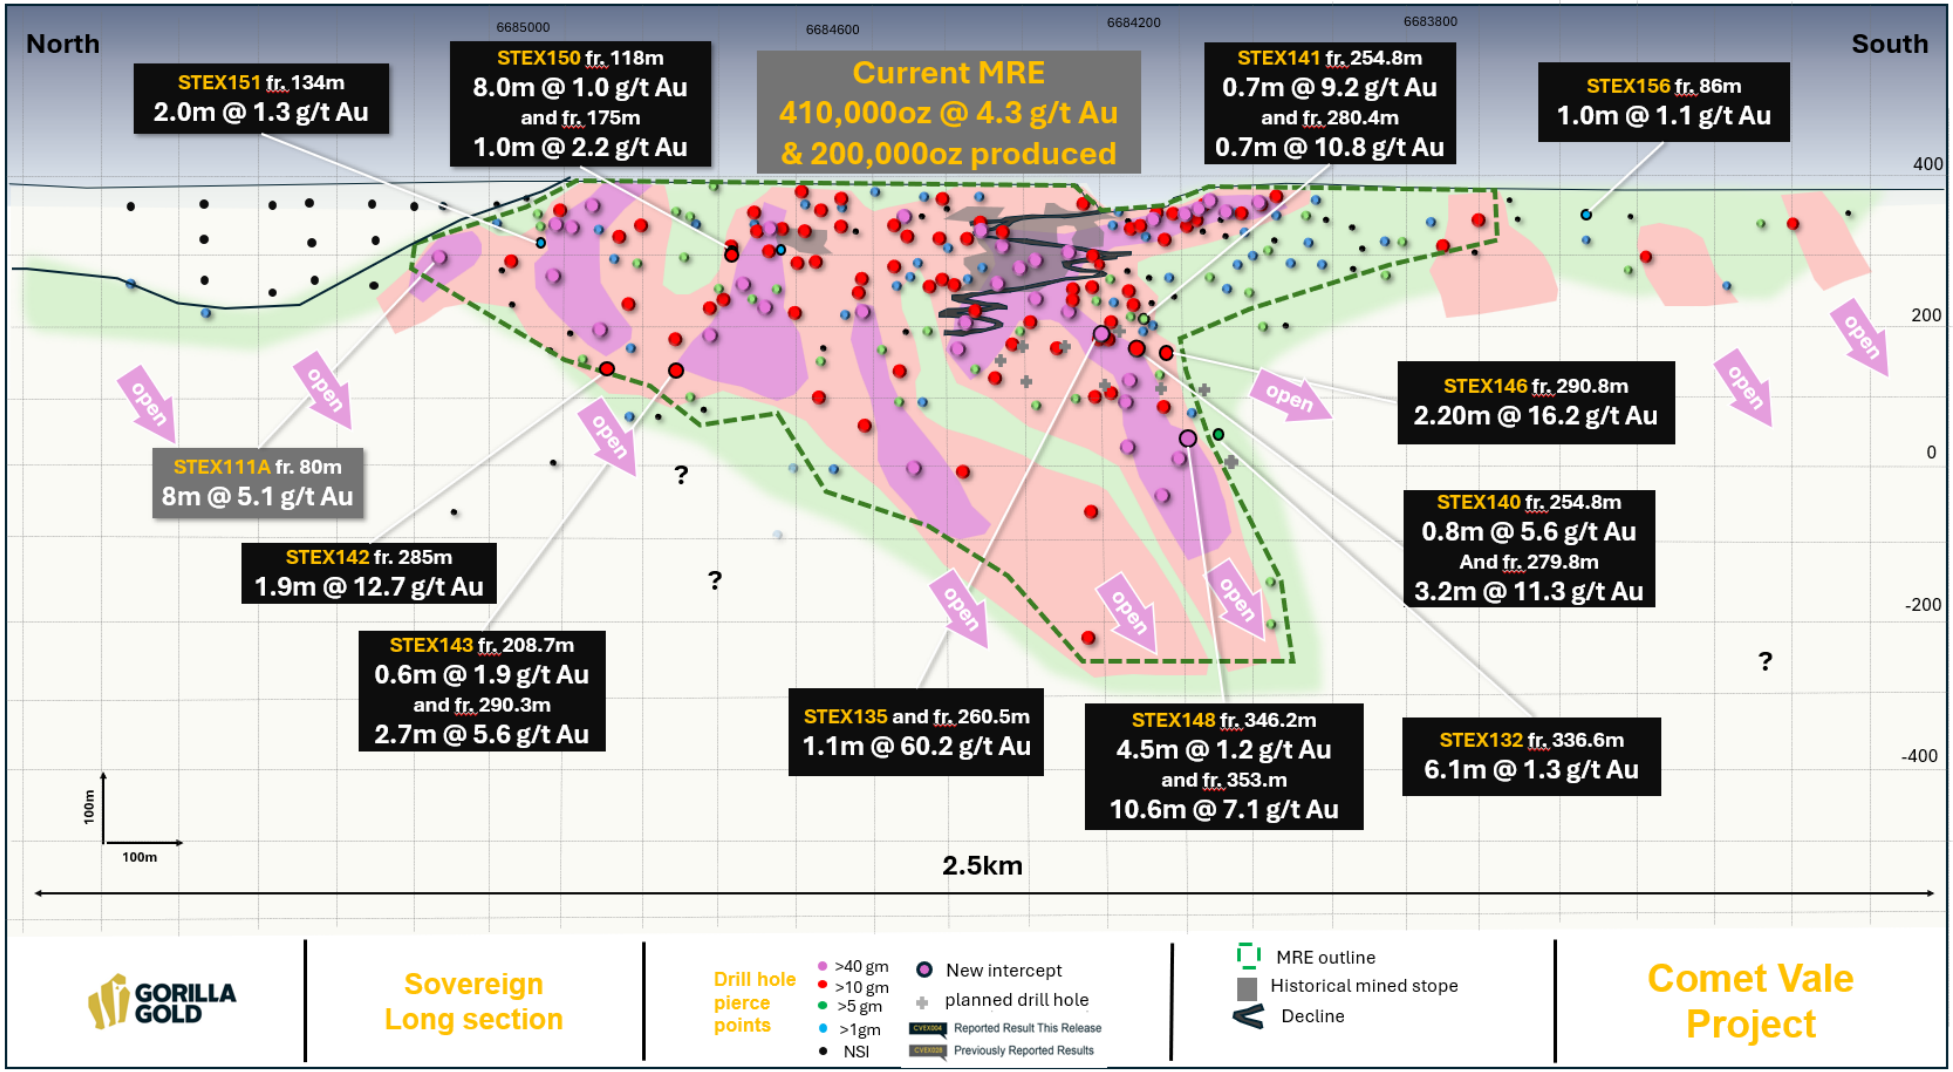

Figure 1. Sovereign Deposit Long Section.

Gorilla Chief Executive Officer, Charles Hughes, commented:

"Our 2026 exploration campaign is now really moving up a gear as the flow of assay results begins to accelerate, with the cornerstone Sovereign Deposit at Comet Vale delivering multiple impressive high-grade hits.

"Sovereign is the largest and highest-grade individual deposit at Comet Vale. It currently hosts 410,000oz @ 4.3g/t Au over a strike length of 1.3km – with clear potential to grow this resource out well past 2.5km in length.

"Importantly, we're seeing multiple parallel lodes developing at Sovereign around the contact of two major lithological units with no real indication of where the lodes finish as we get further into the footwall of this contact. That means there is plenty of growth upside here!

"We are also excited to see some really exceptionally high grades from this round of drilling, with intercepts up to two ounces of gold per tonne. That is a great indication of the incredible endowment and growth potential of the broader Comet Vale Project.

"We are firmly on track to deliver further significant resource growth in 2026, with five rigs turning across the North Kalgoorlie Hub and one rig turning at the Vivien Project. Outside of the discovery and definition work at Sovereign, we are currently drilling a number of exciting greenfield targets at Comet Vale. Plus, drilling is ongoing at Mulwarrie, with more assay results imminent.

"With 150,000 metres of drilling planned across our three key projects in 2026, investors can look forward to what we hope will be a transformational period for Gorilla Gold in the coming months."

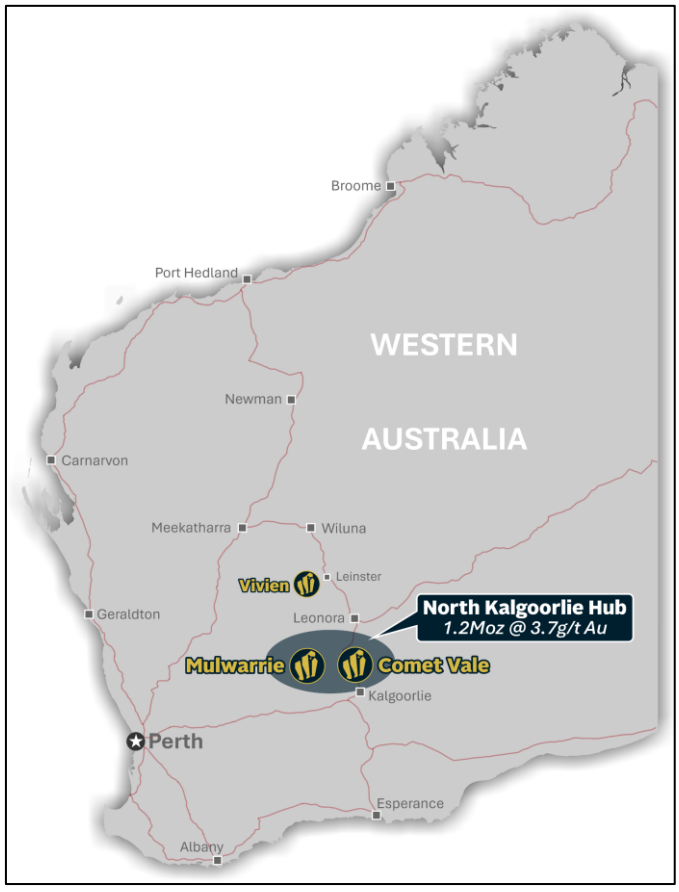

Figure 2. Location of GG8 Projects in WA

Growth and Exploration activities at The North Kalgoorlie Hub

The North Kalgoorlie Hub has a resource base of 1,200,000 oz @ 3.7 g/t Au, is historically under-explored with more than 60km of high priority drill targets. The Hub is composed of the Comet Vale and Mulwarrie Projects, both on granted Mining Licences, close to milling and transport infrastructure.

Gorilla Gold added >1,000,000oz to the resource base of the North Kalgoorlie Hub in 2025 through drilling the targets it had identified.

Gorilla has an aggressive strategy to Discover further gold resources, Define these resources and Develop the project.

The Comet Vale Project has a Mineral Resource Estimate of 0.86Moz @ 3.7 g/t Au, and has seen historical gold production of >200koz @ >20g/t Au, with underground operations occurring as recently as 2020.

The Comet Vale project lies within granted Mining Leases, adjacent to the Goldfields Highway, in a region with multiple operational gold mills within a 100km radius. The Company has identified a 10km by 3km zone of interrelated structural deformation and mineralisation zones within which the Sovereign shear-zone, King Kong shear-zone, and the Silverback shear-zones are situated.

Figure 3. Location of Kalgoorlie North Hub, showing Mulwarrie and Comet Vale Projects.

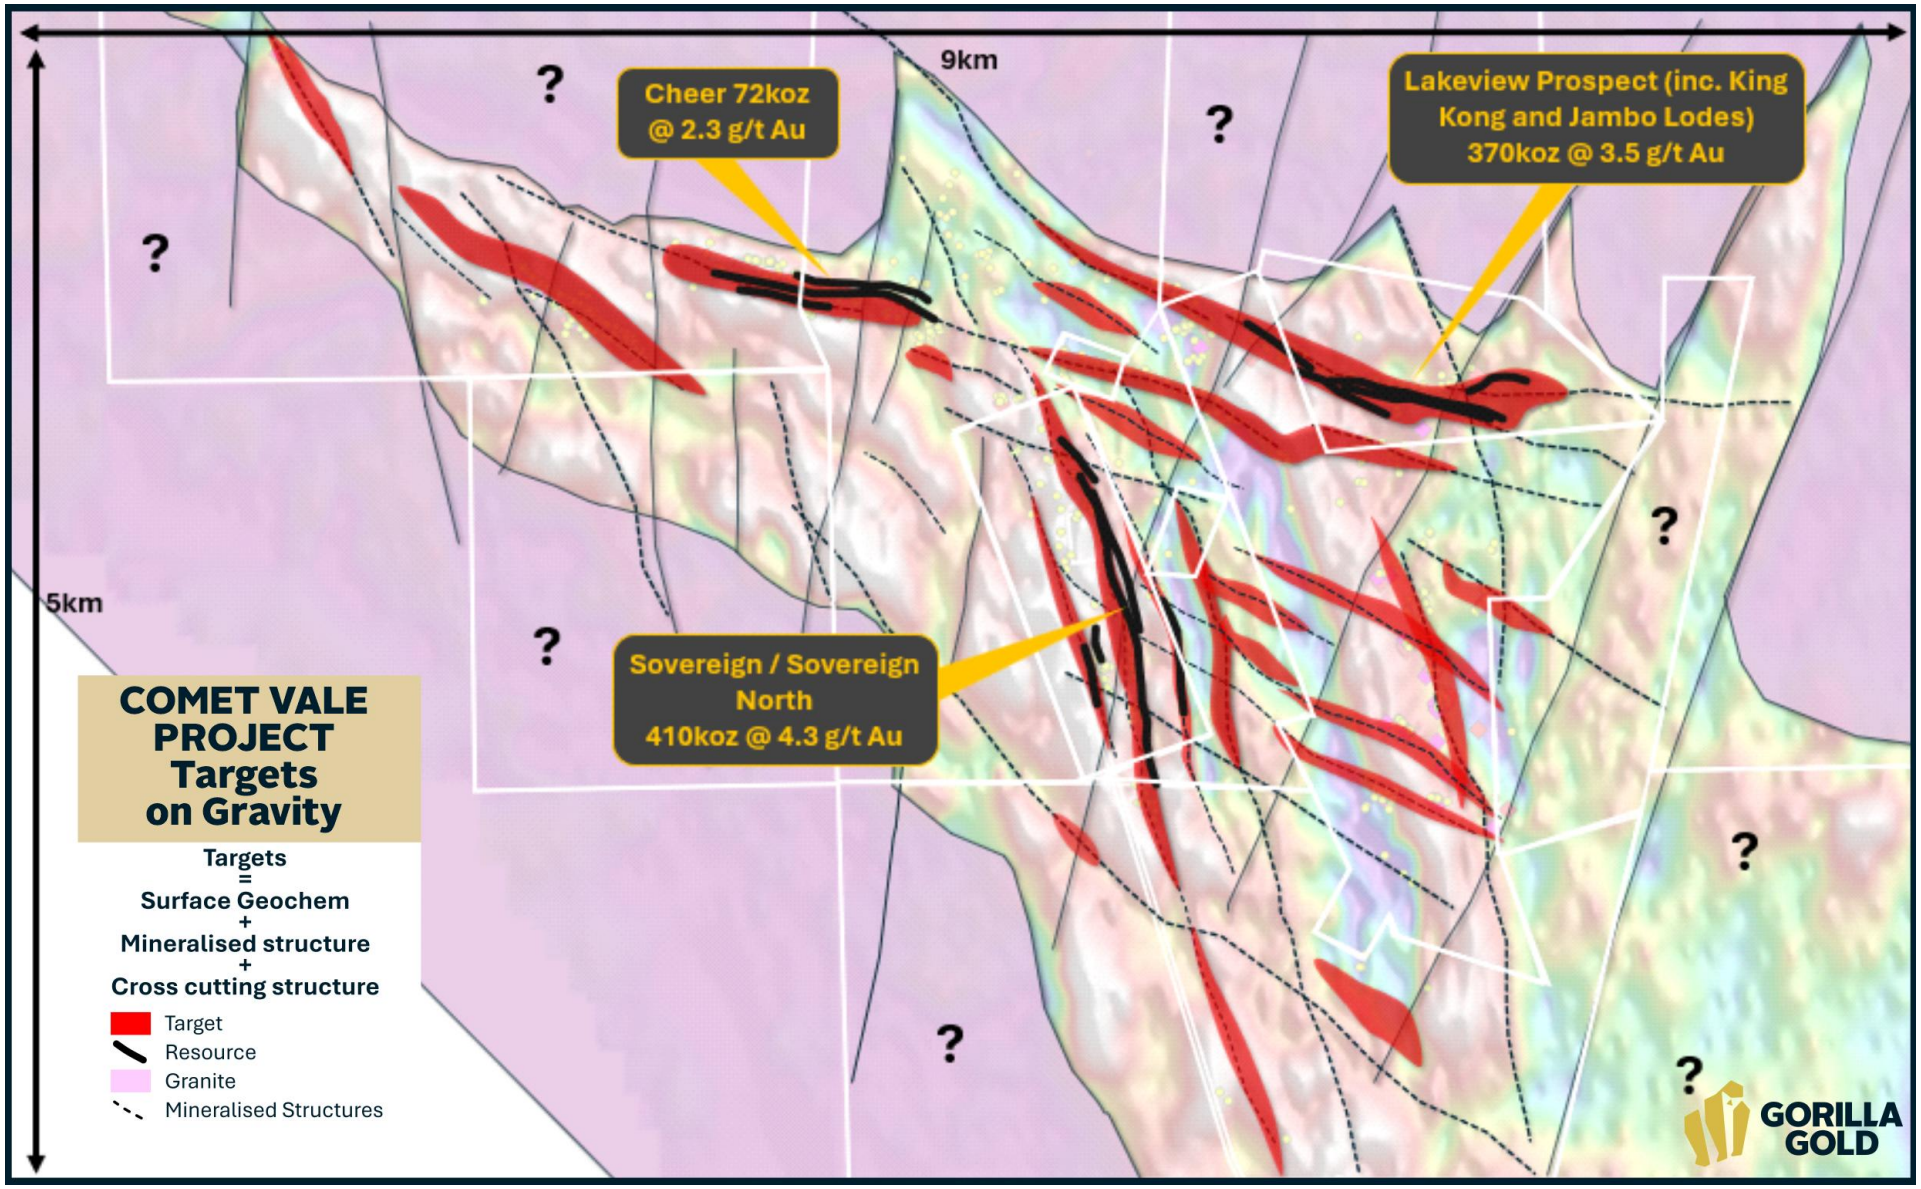

Figure 4. Comet Vale targets and resource areas 2026

Growth drilling at the Sovereign deposit continues to intersect high grade mineralisation

Ongoing drilling targeting Mineral Resource growth continues to intercept high grade gold mineralisation.

Mineralisation at Sovereign is hosted within quartz veins associated with pyrrhotite-chalcopyrite-sphalerite-galena sulphide development, often with visible gold.

Mineralised zones form within shear zones at the margins of lithological contacts, adjacent to a major stratigraphy change from mafic to ultramafic lithologies.

Table 1. New Comet Vale assays, this release

Next Steps at North Kalgoorlie Hub

Three drill rigs are active at **Comet Vale** undertaking Discovery and Definition drilling. RC drilling has completed at the Sovereign East target which was targeting strong gold in soil geochemistry results and the Lakeview South target which targeted strong soil geochemistry plus historic workings and rock chip samples up to 100 g/t Au.

Results from this drilling are expected on an ongoing basis with results from labs coming more slowly at present due to higher demand for laboratories within the industry.

Other Definition work including engineering, geotechnical, metallurgical and hydrological studies are ongoing as well as Development work which at this stage includes permitting work.

Two drill rigs are active at **Mulwarrie** project undertaking growth drilling following up on major step out results GG8 announced to the market on 18 March 2026.

This announcement has been authorised and approved for release by the Board.

Competent Person's Statement:
The information in this announcement relates to exploration results for the Comet Vale and Mulwarrie Projects which Mr. Charles Hughes has reviewed and approves. Mr. Hughes, who is an employee of Gorilla Gold Mines Ltd, a professional geoscientist and a Member of the Australian Institute of Geoscientists. Mr. Hughes has sufficient experience relevant to the style of mineralisation and type of deposits under consideration, and to the activities which have been undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves. Mr. Hughes consents to the inclusion in this announcement of the matters based on this information in the form and context in which it appears.

Specific exploration results referred to in this announcement were originally reported in the following Company announcements in accordance with ASX Listing Rule 5.7:

Title	Date
Mulwarrie High Grade Gold Intercept Beyond Resource	18 March 2026
Thick Drilling Intercepts at Comet Vale	23 February 2026
Comet Vale POWs Granted, Soil Targets and Extra Tenure	2 February 2026
Comet Vale Mineral Resource increases by 900%	15 December 2025
Comet Vale drilling results and MRE update	11 November 2025

APPENDIX 2 JORC TABLES

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Comments
Sampling techniques	▪ Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.	▪ RC drilling - samples collected as 4m composites and in areas where interesting lithology, alteration, mineralisation or veining was encountered, 1m splits were taken. Composite samples are collected from samples piles, 1m splits are taken for every metre from the cyclone with duplicate samples taken at the instruction of the field geologist from the second chut on the cone. DD drilling has samples collected as half core in intervals between 0.3-1m based on lithology.
	▪ Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.	▪ Samples collected by GG8 field crew and submitted to ALS Laboratory in Kalgoorlie, WA. All samples are considered to be representative for the manner in which they are used.
	▪ Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay').	▪ The samples were analysed using the photon assay method which uses a 0.5kg sample and requires minimal handling. The samples are riffle split at the lab and crushed to 80% passing 2mm to ensure homogeneity as uniform sample distribution is important to a quality analysis. SOILS
	▪ In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.	▪ Soil samples were collected by Gorilla Gold and contractors (OZEX Exploration Services and Omni GeoX) personnel on a 400x200m across Mulwarrie (Mulline) and 200x40m, 200x20m and 100x20m grid across Comet Vale. ▪ Samples were collected by digging a 30x30x10cm pit, homogenising and then sieving and collection of a dry 250g –2mm sample. ▪ Samples were submitted to LabWest (Perth) for Ultra Fine Fraction (UFF) separation (<2µm) and analysis by Aqua Regia ICP-MS and ICP-OES for determination of Au and 51 elements.
Drilling techniques	▪ Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	▪ RC drilling was completed by several contractors using multiple modern RC rigs capable of significant drill depths. RC drilling uses a standard 5.5in bit and an auxiliary booster capable of 900psi, sufficient to keep sample dry at most depths. DD drilling was completed by contractors using multiple modern DD rigs. All drill rigs utilised by GG8 are industry best standard.
Drill sample recovery	▪ Method of recording and assessing core and chip sample recoveries and results assessed.	▪ RC sample recovery was qualitatively assessed by the field geologists. Good recoveries were had. DD recovery measured actual core length between drillers blocks to the nearest cm. Sample weights are recorded by the laboratory and average 3kg.
	▪ Measures taken to maximise sample recovery and ensure representative nature of the samples	▪ Sample depths were cross-checked regularly. The cyclone was regularly cleaned to ensure no material build up and sample material was checked for any potential downhole contamination. The drilling sample recoveries/quality are acceptable and are appropriately representative for the style of mineralisation.

	▪ Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	▪ No obvious sample recovery biases or biases related to loss or gain of fines have been identified.
Logging	▪ Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	▪ Logged for geology on the 1m intervals with chips washed and stored in chip trays by the geologist. Logging was inputted directly into the onsite laptops using suitable Company logging. ▪ DD core stored in trays with every metre logged. ▪ Logging is of a qualitative nature.
	▪ Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.	▪ RC chips and DD were logged for lithology, colour, weathering, texture and minerals present. Structural measurements and geotechnical data were recorded on DD core
	▪ The total length and percentage of the relevant intersections logged.	▪ N/A
Sub-sampling techniques and sample preparation	▪ If core, whether cut or sawn and whether quarter, half or all cores taken.	▪ Core is sawn with half cores taken for assay
	▪ If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.	▪ RC drilling single 1 metre splits were automatically taken at the time of drilling by a cone splitter attached to the cyclone. 4m composite samples were taken from sample piles. Samples have been dry. Samples are then riffle split at the lab into 0.5kg samples and crushed to 2mm prior to photon assay with a particle size distribution test to ensure 80% passing the 2mm threshold. SOILS ▪ Soil samples were submitted to LabWest in Perth where the -2µm particle size fraction is extracted using the Ultra Fine method developed by CSIRO and LabWest.
	▪ For all sample types, the nature, quality and appropriateness of the sample preparation technique.	▪ The technique was appropriate for the work undertaken. During RC logging samples that showed mineralisation, veining or alteration had 1m split samples collected. 1m split samples are later taken from where 4m composites show >0.2g/t gold anomalism. During DD logging any sulphide veining or alteration were sampled. SOILS ▪ The Ultra Fine Fraction sampling and analysis has been proven to be an effective technique for gold exploration across a wide range of regolith types.
	▪ Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.	▪ QAQC reference samples and duplicates were submitted by GG8. In house standards and blanks were also inserted by ALS. SOILS ▪ Sub-sampling is conducted by LabWest using their proprietary UFF method.
	▪ Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.	▪ 1m samples are automatically bagged from the cyclone, field duplicates are taken from a second chute off the splitter. DD duplicates are taken by sampling quarter core over the same interval as the primary sample. SOILS ▪ Every 50 samples a field duplicate is collected by digging a second pit within 2-3m of the original sample pit, homogenising and then sieving and collection of a dry 250g -2mm sample.
	▪ Whether sample sizes are appropriate to the grain size of the material being sampled.	▪ All RC samples are collected to approximately 1-5 kg. The sample sizes taken are appropriate relative to the style of mineralisation and analytical methods undertaken. DD sample size is appropriate. SOILS

		▪ Sample sizes are appropriate for the grain size of the material sampled.
Quality of assay data and laboratory tests	▪ The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.	▪ All samples were sent to ALS laboratory in Kalgoorlie. Photon Assay method has shown to provide quick turnaround times and high accuracy. SOILS ▪ Samples were screened in the field to -2mm. LabWest then takes a sub-sample of <2µm material for analysis. ▪ The UFF sample preparation was defined following a Research and Development project conducted under the direction of CSIRO. ▪ Field duplicates are submitted and perform to internal GG8 standards.
	▪ For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	▪ All analytical results from drilling listed are from an accredited laboratory using photon assay method with fire assay as a check method.
	▪ Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.	▪ Certified Reference Materials (CRMs) are included in each batch to ensure the reliability of the assay. These CRMs, such as OREAS254C, OREAS230, and OREAS241, are specifically chosen for photon assay to maintain quality standards and were evaluated against published certificates. The standard deviation was minimal for samples. Selected photon assays over a range of grades and from different parts of orebodies are umpire checked with Fire Assays and so far shows no material difference in reported grades. SOILS ▪ Field duplicates at a frequency of 1:50 are submitted and performed to GG8 internal standards.
Verification of sampling and assaying	▪ The verification of significant intersections by either independent or alternative company personnel.	▪ External verification has not been carried out, but values were checked against logging and photographs to ensure the intersected Au values are in line with logged alteration, mineralisation or veining. Significant intercepts have been verified by the Exploration Manager, the CEO and Principal consulting geologist. SOILS ▪ Significant results are revisited with ground-truthing and follow-up sampling where appropriate.
	▪ The use of twinned holes	▪ No twinned holes at this stage as the project is still advancing.
	▪ Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	▪ Data was captured directly into specific geological logging software. Assay files have been sent directly from the lab to database manager to avoid operator errors. All physical sampling sheets are filed and scanned electronically and submissions to the lab checked to ensure that no samples are missing or incorrect IDs. SOILS ▪ Sample locations and track files are stored directly onto the sampler's GPS and downloaded for verification. Assay files have been sent directly from the lab to database manager to avoid operator errors. All physical sampling sheets are filed and scanned electronically and submissions to the lab checked to ensure that no samples are missing or incorrect IDs.
	▪ Discuss any adjustment to assay data.	▪ No adjustments were made to the assay data because none are needed.

Location of data points	▪ Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	▪ Samples were located using handheld Garmin GPS, the GPS is accurate within 3-5m.
	▪ Specification of the grid system used.	▪ All locations and maps quoted in this Report are using the GDA1994 MGA, Zone 51 coordinate system.
	▪ Quality and adequacy of topographic control.	▪ Topography based on detailed topographic surveys.
Data spacing and distribution	▪ Data spacing for reporting of Exploration Results.	▪ Data spacing is varied SOILS ▪ Data spacing is varied with sampling at 400x200m across Mulwarrie (Mulline) and 200x40m, 200x20m and 100x20m grid across Comet Vale.
	▪ •Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.	▪ Data spacing is sufficient for the Mineral Resources estimate, no Reserves have been estimated yet.
	▪ Whether sample compositing has been applied.	▪ Intercepts are aggregated based upon 0.5g/t Au cut-off grade and 3m of dilution material.
Orientation of data in relation to geological structure	▪ Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.	▪ The relationship between the drilling orientation and the orientation of mineralised structures is not considered to have introduced a sampling bias. Most holes have been drilled perpendicular to the main orientation of the interpreted mineralised zone. SOILS ▪ Soil lines have been oriented perpendicular to interpreted structures and lithological contacts as appropriate in orogenic gold exploration.
	▪ If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	▪ No drilling orientation related sampling bias has been identified at the Project. Some orientation changes were made to historic holes, and the main structure was intersected at the interpreted depth.
Sample security	▪ The measures taken to ensure sample security.	▪ Samples were transported from the field to the lab by GG8 personnel or GG8's freight contractor. SOILS ▪ Samples were transported from the field to LabWest by GG8's freight contractor.
Audits or reviews	▪ The results of any audits or reviews of sampling techniques and data.	▪ GG8 undertakes continuous audits and reviews of all its field processes and results.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	▪ Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.	Gorilla Gold Mines Ltd 100% owns the projects through its wholly owned subsidiaries. COMET VALE M29/35, M29/52, M29/85, M29/185, M29/186, M29/197, M29/198, M29/199, M29/200, M29/201, M29/232, M29/233, M29/235, M29/270, M29/321 Kakara Part A has been granted Native Title over the project area. The Company does not at present have any agreements with Kakara part A but are in the process of engagement. MULWARRIE M30/119, M30/145, E30/511, E30/512, E30/513, P30/1141, P30/1142, P30/1143. Marlinyu Ghoorlie has a Native Title claim over the project area. The Company has an existing agreement over the majority of the project area and is currently negotiating the inclusion of the additional tenements with Marlinyu Ghoorlie.
	▪ The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	▪ No known impediments exist with respect to the exploration or development of the tenements.
Exploration done by other parties	▪ Acknowledgment and appraisal of exploration by other parties.	▪ See previous announcements. In particular ASX announcement, 13 September 2024, Review of Historical Vivien and Comet Vale Databases and the Bardoc/Spitfire ASX announcement 19 March 2019, High-grade diamond drilling results at Mulwarrie confirm lode structures and pave way for resource upgrade.
Geology	▪ Deposit type, geological setting and style of mineralisation.	COMET VALE & MULWARRIE Archean orogenic gold mineralisation associated with major structures and mafic-ultramafic stratigraphy with intermediate intrusives adjacent to intracratonic monzogranites, gold mineralisation is associated with quartz veining, pyrrhotite chalcopyrite, galena, sphalerite, and amphibole-biotite-chlorite alteration.

Drill hole Information	▪ A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: ▪ easting and northing of the drill hole collar ▪ elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar ▪ dip and azimuth of the hole ▪ down hole length and interception depth ▪ hole length.	▪ Tables reported in the announcement.
	▪ If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	▪ No information material to the understanding of the exploration results has been excluded.
Data aggregation methods	▪ In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.	▪ Assay results reported here have been length weighted. ▪ No metal equivalent calculations were applied. ▪ Cut off grades is 0.5g/t Au
	▪ Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.	▪ All samples were 1m or 4m samples were reported as returned. ▪ Compositing is based on a maximum of 4m internal dilution with a minimum cut off of 0.5g/t Au.
	▪ The assumptions used for any reporting of metal equivalent values should be clearly stated.	▪ No weighting used.
Relationship between mineralisation widths and intercept lengths	▪ These relationships are particularly important in the reporting of Exploration Results.	▪ All samples reported are downhole width.
	▪ If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.	▪ Mineralization is generally perpendicular to drilling orientation.
	▪ If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').	▪ All intercepts are down hole lengths, true widths not yet determined.

Diagrams	▪ Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	▪ Plans and sections are located in the body of the announcement.
Balanced reporting	▪ Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	▪ All samples were reported for Au and their context discussed. SOILS ▪ The accompanying document is a balanced report with a suitable cautionary note. ▪ Statistics for UFF soil samples (Au) within the Comet Vale project to date (n: 2,377) are: Minimum: 0.8 ppb Maximum: 24,049 ppb Median: 22 ppb Mean: 77 ppb S.D: 687 ppb 90%: 89 ppb 95%: 152 ppb 98%: 329 ppb ▪ Statistics for UFF soil samples (Au) within the Mulwarrie-Mulline project to date (n: 1,677) are: ▪ Minimum: <0.5 ppb ▪ Maximum: 5070.6 ppb ▪ Median: 5.8 ppb ▪ Mean: 11 ppb ▪ S.D: 124 ppb ▪ 90%: 14.8 ppb ▪ 95%: 21.8 ppb ▪ 98%: 32.3 ppb ▪ ▪ Excluding outlier max value of 5070.6 ppb (n: 1,676): ▪ Minimum: <0.5 ppb ▪ Maximum: 160.2 ppb ▪ Median: 5.8 ppb ▪ Mean: 8 ppb ▪ S.D: 9.7 ppb ▪ 90%: 14.8 ppb ▪ 95%: 21.7 ppb ▪ 98%: 32.3 ppb
Other substantive exploration data	▪ Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	▪ All other relevant data has been included within this report.

Further work	▪ The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).	COMET VALE Additional soil sampling across the Comet Vale project is planned. Drilling is ongoing, refer to end of text for more comprehensive update. MULWARRIE Additional soil sampling across the Mulwarrie project is planned and drilling is scheduled to recommence in Q4 2025.
	▪ Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	▪ Supporting diagrams are all found in the body of the text.
