EXPANDED MAIDEN DRILL PROGRAM AT BARLEE COMPLETE

HIGHLIGHTS

- First ever drill program testing multiple, large and high amplitude gold anomalies at Barlee Gold Project has been completed.
- The initial 4,500 metre program was expanded to over 6,000 metres of RC and aircore drilling testing a total of eight prospects.
- Twenty-eight RC holes for a total of 2,800 metres and sixty-nine aircore holes for a total of 3200 metres were completed.
- Samples have been dispatched to the laboratory and assays are expected within 6 weeks.
- Option exercised to acquire the Killarney Gold Project.

Duketon Mining Limited (**Company** or **DKM**) is pleased to announce that drilling has been completed at the Barlee Gold Project (**Project**). Approximately 3,200 metres of aircore and 2,800 metres of RC was drilled over eight prospect areas. Samples have been dispatched to the laboratory and assays are anticipated within six weeks.

Managing Director Stuart Fogarty said *"We are very pleased to have successfully completed the maiden drilling program at the Barlee Gold Project, marking an important milestone for the Company. Importantly, this is the first ever drill campaign to systematically test multiple large-scale and high-amplitude gold anomalies identified across the project area.*

"With drilling now complete, all samples have been dispatched to the laboratory and we look forward to receiving assay results over the coming six weeks. These results will provide the first comprehensive assessment of several priority gold targets and will guide the next phase of exploration.

In addition, the exercise of the option agreement to acquire the Killarney Gold Project further strengthens the Company's exploration portfolio and expands our exposure to highly prospective gold terrain in Western Australia."

Killarney Gold Project

DKM has exercised its Option to acquire the Killarney Gold Project comprising tenements M58/365 and P58/1843. Completion is expected to occur shortly.

Key Terms of the Option Agreement:

Duketon paid the vendor $50,000 for an exclusive 12-month option to acquire M58/365 and P58/1843 (combined is the Killarney Gold Project) (ASX announcement 10th April 2025 – Duketon Signs Option to Acquire High Grade Gold Project)

The Company has exercised the option to acquire 100% of the Killarney Gold Project by agreeing to issue the Vendor 2,000,000 fully paid ordinary shares in the capital of DKM.

12 May 2026

Boodanoo Project

Assays have been received from the RC drill program at the Boodanoo Project, no significant gold assays over 0.2 g/t Au were returned.

Competent Person Statement:

The information in this release that relates to exploration results is based on historical and current information compiled by Ms Kirsty Culver, Member of the Australian Institute of Geoscientists (AIG) and an employee of Duketon Mining Limited. Ms Culver has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity that is being undertaken to qualify as a competent person as defined in the JORC Code 2012. Ms Culver consents to the inclusion in the report of the matters based on the information in the form and context in which it appears.

Validity of Referenced Results

The information in this report that references previously reported exploration results have been extracted from the Company's ASX market announcements released on the date noted in the body of the text where that reference appears. The previous market announcements are available to view on the Company's website or on the ASX website (www.asx.com.au). The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

JORC Table 1

JORC Code, 2012 Edition – Table 1 report – Barlee Project

Section 1 Sampling Techniques and Data – Boodanoo RC & Barlee AC & RC Drilling

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• Aircore drill chips were collected as 1 metre samples from the drill rig cyclone to provide 1m samples. • Aircore samples were collected from bulk piles laid out next to the drillhole collar using an aluminium scoop, scooped in such a manner as to ensure portions of the whole pile were sampled. This is standard industry practice for this type of early phase drilling. Sample size is approximately 2kg. • RC drill chips were collected from the rig cyclone and cone splitter to provide a 1 metre sample. Composite samples were collected using a spear. Sample size is approximately 2kg. • Certified standards, blanks and field duplicates are routinely added to every batch of samples. • Zones of interest determined qualitatively by geological logging.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• Drilling was undertaken using a 6 x 6 multipurpose Schramm T450 rig • Aircore drilling using a 4-inch face sampling blade. • RC drilling using a 5-inch face sampling hammer

Criteria	JORC Code explanation	Commentary
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• Recoveries qualitatively noted at the time of drilling and recorded in the DKM database. • The cyclone of the drill rig is cleaned at the end of each rod to ensure sample is not “hung-up” and samples are as clean as possible with as little cross contamination as possible.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• All samples were logged to a level of detail to support future use in a mineral resource calculation should it be required. • Qualitative: Lithology, alteration, mineralisation. • Quantitative: Vein percentage, sulphide percentage. • All holes are logged for their entire length.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• AC drill chips were collected as 1m, 2m 3m or 4m composite samples from bulk piles laid out next to the drillhole collar using an aluminium scoop. • End of hole metre collected as a one metre sample. • RC drill chips were collected as 1 metre samples from the rig cyclone and cone splitter to provide a 1 metre sample. Composite samples were collected using a spear. • Sample condition with respect to moisture content is noted on the geological log. • The entire sample (approx. 2kg) has been dried, pulverised to 85% passing 75µm. • Standards, duplicates and blanks are routinely added to every batch. • Additionally, the laboratory inserts lab blanks, standards and duplicates which are reported in the laboratory assay file

Criteria	JORC Code explanation	Commentary
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	BOODANOO • Samples were analysed by a 50g Fire Assay charge with OES finish for Au and ICP-OES for 33 elements. • This technique is industry standard for gold and is considered appropriate. • Certified Reference Material (Standards & blanks) were submitted with batches.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• All data is checked internally for correctness by senior DKM geological and corporate staff. • All data is collected via Ocris software and uploaded into the DKM Datashed Database. • No twinned holes have been drilled to date.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• All location points are collected using a handheld GPS in MGA 94 – Zone 50. • For Barlee drillholes a topographic surface has been created from airborne geophysical data. Drillholes have been corrected to this surface. • Downhole surveying (azimuth and dip of the drillhole) of diamond drillholes was measured by the drilling contractors using a north seeking Gyro tool.

Criteria	JORC Code explanation	Commentary
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• Holes at are drilled at various spacing. • Hole spacing is appropriate for drilling at this stage. • Sample compositing has been applied.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	BARLEE • The orientation of the major structures is approximately 330 degrees. Drillhole dip and azimuth provided in collar table. BOODANOO • The orientation of major structures is approximately 360 degrees. Drillhole dip and azimuth provided in collar table.
Sample security	• *The measures taken to ensure sample security.*	• Chain of custody is managed by company representatives and is considered appropriate. All samples are bagged in a tied numbered calico bag, grouped into larger polyweave bags and cable tied. Polyweave bags are placed into larger bulky bags with a sample submission sheet and tied shut. Consignment note and delivery address details are written on the side of the bag and delivered to the freight yard. The bags are delivered directly to Intertek in Maddington, WA who are NATA accredited for compliance with ISO/IEC17025:2005.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• No external audits or reviews have been conducted apart from internal company review.

ASX Announcement

12 May 2026

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	BARLEE • The tenements (E77/2717 & E77/3160) are 100% owned by Duketon Mining Limited and are in good standing and there are no known impediments to obtaining a licence to operate in the area. BOODANOO • The tenement (E59/2881) is held by Western Yilgarn NL (Vendor) and is currently in good standing and there are no known impediments to obtaining a licence to operate in the area.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	BARLEE • Previous work by various companies including Twenty Seven Co, Savage Resources Limited, Polaris Metals NL, Anglo Australian Resources, Helix Resources, Beacon Minerals Ltd, WMC Corporation, Oxiana Limited, FYI Resources, Tanami Exploration NL, Rox Resources, MPI and North Limited. BOODANOO • Previous exploration on E59/2881 has been carried out by Seremin Pty Ltd – 2021. Detailed in WAMEX Report A129467.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• Typical Archean gold quartz vein mineralisation within mafic and sedimentary rocks.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar*	• A table of drill collar locations is provided in the body of the report.

Criteria	JORC Code explanation	Commentary
	○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.*	
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• No assay results reported.
Relationship between mineralisation widths and intercept lengths	• *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• No assay results reported. •
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Refer to figures in document.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of*	• All drillhole locations are reported in the release text.

Criteria	JORC Code explanation	Commentary
	Exploration Results.	
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Refer to document.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• A discussion of further work is contained within the body to this ASX release.
