

15 June 2026

Blue Tungsten Prospect Expands to 4.7km x 3.4km

Highlights

- **Large-scale tungsten anomaly expands to 4.7km x 3.4km**, following accelerated surface sampling at the Blue Prospect, with the system remaining open in all directions.
- **Strong tungsten anomaly confirmed**, with multiple samples from the second phase of geochemical exploration continuing to return results **greater than 10 times background levels (pXRF)**.
- **High-grade tungsten potential demonstrated**, with previous rock chip results of up to **4.3% WO₃** (*ASX Announcement: 21 May 2026*).
- The Company has successfully collected surface outcrop material for its **maiden tungsten metallurgical testwork program**, with **testwork underway** to assess tungsten recovery characteristics.
- Ongoing tungsten prospectivity continues to support the Company's preliminary **RIRGS exploration model**, developed in collaboration with **CODES (University of Tasmania)**, increasing confidence in its application to the region.
- New tenement **EL9922 (Rosewood) granted**, expanding the Company's tenure across a **highly prospective corridor south and west of Tumbarumba**
- **Tungsten is an Australian Government critical mineral**, with growing strategic demand across defence, advanced manufacturing and energy sectors.

Right Resources Limited (ASX: RRE) (Right Resources or the Company) is pleased to provide an update on activities at the Blue tungsten prospect (**Blue Prospect or Blue**), located near Tumbarumba, New South Wales. Ongoing soil sampling, geological mapping and rock chip collection continue to enhance the prospectivity of the project to host economic tungsten mineralisation.

Commenting on the results, Managing Director Graham Howard said:

"These latest results from the Blue tungsten prospect at Tumbarumba confirm that the target is expanding at significant scale, with the anomalous tungsten zone remaining open in all directions. The combination of elevated geochemical results and observable tungsten mineralisation in outcrop gives us increasing confidence in the project's subsurface potential."

Phase 2 Surface Mapping and Sampling

Geochemical Analysis

Systematic pXRF soil sampling has significantly expanded the previously defined geochemically anomalous area at Blue by more than 320%, with the target now extending across 4.7km x 3.4km (Figure 1 and Figure 2). Phase 2 work has focused primarily on the eastern and southern extents of the anomaly, with Phase 3 planned to test the northern and western extensions.

The target area is characterised by coincident tungsten (W) (Figure 2), bismuth (Bi) and molybdenum (Mo) (Figure 5) enrichment and remains open in all directions.

Sampling is being undertaken on a nominal 200m x 200m grid to establish the scale of the mineralised system. Results continue to indicate that the system remains open. Multiple vein zones have been mapped and documented within the anomalous footprint, and representative outcrop samples have been submitted for multi-element assay analysis.

The anomaly is interpreted to extend westward onto EL9889 (Figure 4, granted April 2026). Additional soil and outcrop sampling is ongoing to define the full extent of the system.

During concurrent mapping activities, the Company's geological team has identified primary tungsten mineralisation including scheelite and wolframite, along with additional tungsten oxide minerals interpreted from field observations, including tungstite, meymacite and stolzite.

These observations are consistent with the interpretation of a coherent tungsten-bearing mineralised system underlying the geochemical anomaly.

The target area has already demonstrated the potential to host high-grade tungsten mineralisation, with the Company previously reporting a peak rock chip result of **34,600 ppm W (3.4% W, equivalent to approximately 4.3% WO₃)** (ASX Announcement: 21 May 2026).

Grade Context:

- Tungsten deposits are typically reported in WO₃ (tungsten trioxide); 3.4% W is equivalent to approximately 4.3% WO₃.
- Rock chip results are selective samples of outcrop and subcrop and are not necessarily representative of average mineralisation across the broader prospect area; however, they confirm the presence of high-grade tungsten mineralisation within the defined anomaly and support ongoing systematic exploration.

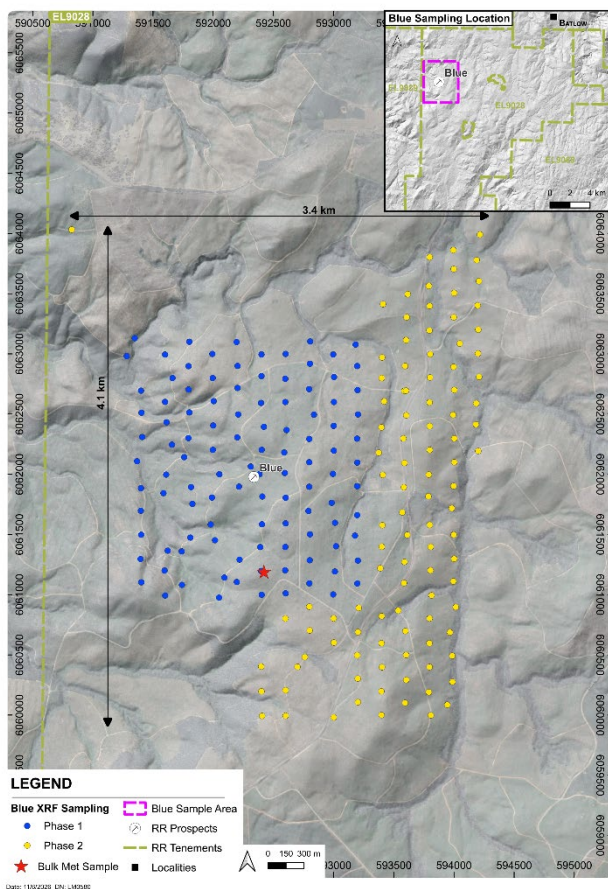

Figure 1: Blue Prospect Phase 1 and Phase 2 surface sampling location map, Tumbarumba district, NSW.

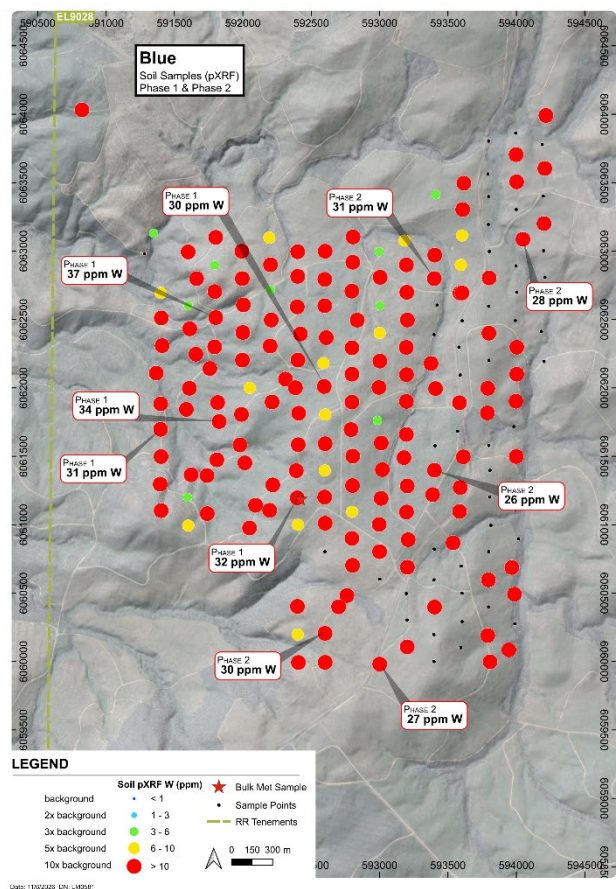

Figure 2: Tungsten (W) pXRF soil anomaly at Blue Prospect (4.7 km x 3.4 km). High-grade certified rock chip results occur within the defined anomaly¹.

¹ Refer to ASX announcement dated: 21 May 2026

Maiden Metallurgical Sample

The Company has collected the maiden metallurgical sample from the Blue Prospect (Figure 3). Testwork will be conducted in Perth, Western Australia, with results to be released progressively as stages are completed. This work is aimed at understanding the metallurgical characteristics and recovery potential of the tungsten mineralisation.

Figure 3: Photographs of material from maiden metallurgical sample showing scheelite under short-wave UV light displaying characteristic bright blue fluorescence, **assays pending**.

Grant of New Tenement – Rosewood EL9922

The Company confirms that exploration licence EL9922 (Rosewood) was granted on 29 May 2026 (Figure 4). This increases the Company's total tenure in the Tumbarumba region to 2,261km², and 2,459km² across its total NSW tenure package, securing additional prospective ground to the south and west of Tumbarumba.

Background - Blue Prospect Discovery

The Blue Prospect lies within the broader regional setting of the Pilot Project but represents a distinct and independent mineral system. It was identified through the Company's systematic regional exploration program, applying the Reduced Intrusion-Related Gold System (RIRGS) model developed in collaboration with CODES (Centre for Ore Deposit and Earth Sciences, University of Tasmania).

The model predicts a characteristic metal zonation pattern, with tungsten and bismuth expected in a proximal position to an intrusion-related hydrothermal system, consistent with the geochemical signature observed at Blue.

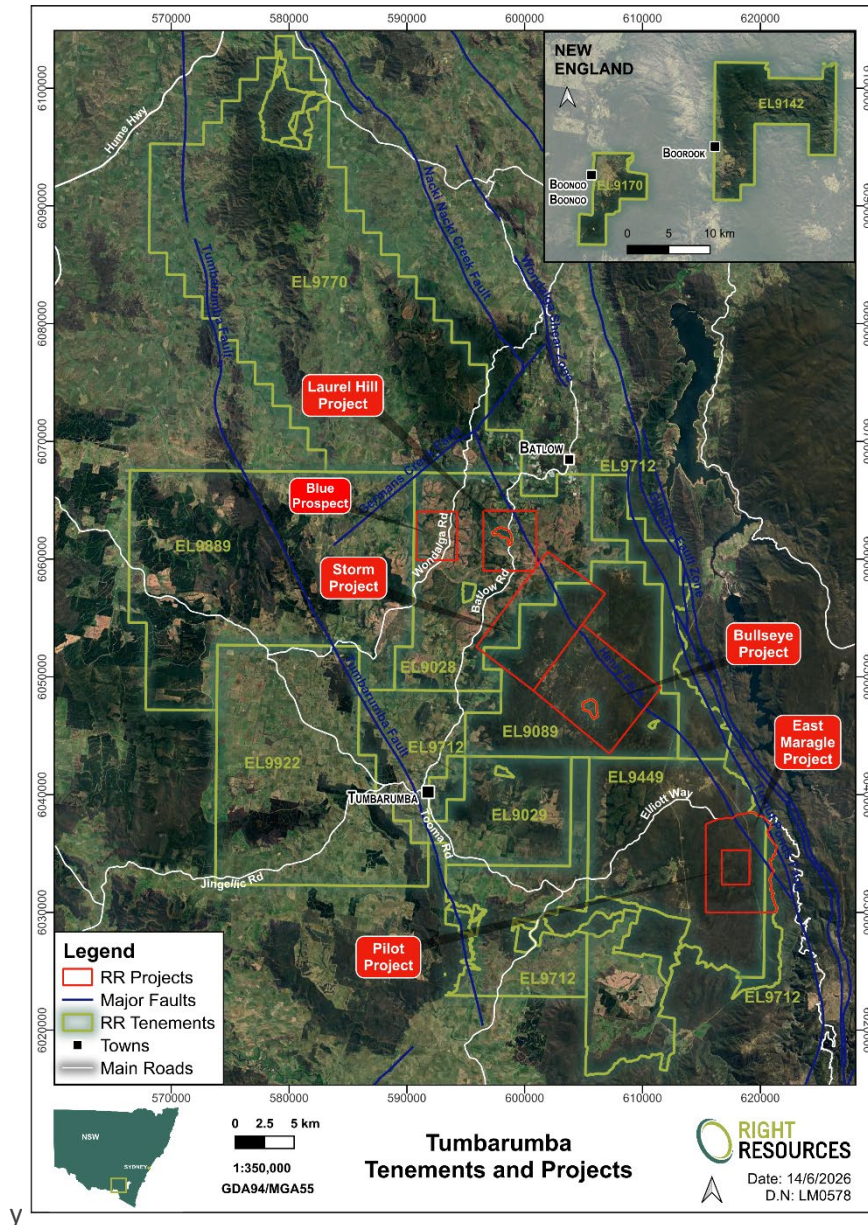

Figure 4: Company tenement overview

Next Steps

- Continue systematic soil sampling and geological mapping at Blue Prospect to define the full extent of the anomaly, including the northern and western extension on EL9028 and EL9889
- Complete assay analysis of outcrop samples used in the metallurgy testwork program
- Progress early-stage metallurgical testwork to support understanding of tungsten recovery characteristics
- Advance targeting with follow-up geophysics and subsurface interpretation to identify drill targets
- Completion of permitting for drill testing of the Blue Prospect system
- Release initial CODES analysis of the broader Tumbarumba district following review

ENDS

This announcement has been approved for release by the Board of Right Resources Limited.

About Right Resources (ASX: RRE)

Right Resources Limited is a New South Wales-based mineral exploration company focused on advancing a portfolio of gold, copper and critical mineral assets across 2,459 km² of tenements in the Tumbarumba and New England regions, both located within historically significant goldfields and mineral provinces.

The Company's flagship asset is the Pilot Project, a high-grade gold target in the Tumbarumba Region with a history of high-grade underground gold production (~38 g/t Au), which is being advanced through a maiden diamond drilling programme in collaboration with CODES (Centre for Ore Deposit and Earth Sciences, University of Tasmania). The Blue Prospect tungsten discovery adds a significant critical minerals dimension to the Company's portfolio.

Forward Statements

This announcement may contain forward-looking statements or information, including forecasts, projections, opinions and conclusions. These statements are not guarantees of future performance or statements of fact. Actual events and results may differ materially due to a variety of risks, uncertainties and other factors, including funding requirements, metal prices, exploration and development risks, and operational challenges. Rock chip results are selective samples of outcrop and are not necessarily representative of average mineralisation across the broader prospect area and should not be relied upon as an indication of bulk grade or mineralised tonnage.

Competent Person Statement

Graham Howard

The information in this announcement that relates to Exploration Results is based on and fairly represents information and supporting documentation compiled by Graham Howard, who is Managing Director of Right Resources Limited. Mr Howard is a Competent Person who is a Fellow of the Australian Institute of Mining and Metallurgy (AusIMM).

Mr Howard has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration, and to the activity being undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves" (JORC, 2012). Mr Howard consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

Previously Reported Exploration Results

The information in this announcement that relates to the Company's Exploration Results has been extracted from the Company's previous ASX announcements dated 21 May 2026, 26 May 2026 and 4 June 2026. The Company confirms that it is unaware of any new information or data that materially affects the information included in those announcements. To the extent disclosed above, the Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements. All previously released market announcements referred to within this announcement can be found on the Company's website at rightresources.com.au.

Appendix 1 - JORC Table 1, Sections 1 - 2

Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. 	<ul style="list-style-type: none"> No drilling has been completed by the Company across EL9028. Samples taken by the Company across the Blue Prospect, EL9028 include: <ul style="list-style-type: none"> Metallurgy surface rock samples of outcrop and subcrop were collected by experienced field crew. These samples included; in-field UV light, pXRF and geological mineral identification. A subset of the metallurgy sample has been issued for initial head grade analysis to ALS Brisbane. Rocks f between 5 centimetres to 15 centimetres in diameter were collected in a single location (Figure 1) and approximately 50 kg issued for metallurgy testwork A further 35 samples of rock outcrop have also been completed as part of surface mapping and sampling and have been submitted for assay. 211 surface soil samples (Phase 1: 107, Phase 2: 104) from the B Horizon were analysed using a portable XRF analyser. XRF analysis are point samples of soil samples collected. Company protocol is to take five (5) XRF readings per soil sample. Readings are recorded and primary sample retained for future analysis The Company also applied visual and use of short wavelength ultraviolet light to confirm visible scheelite.
Drilling Techniques	<ul style="list-style-type: none"> Drill type (eg. core, reverse circulation, open hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc) 	<ul style="list-style-type: none"> No drilling has occurred across the Blue Prospect on EL9028.
Drill sample recovery	<ul style="list-style-type: none"> Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<ul style="list-style-type: none"> No drilling has occurred across the Blue Prospect on EL9028.
Logging	<ul style="list-style-type: none"> Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. 	<ul style="list-style-type: none"> All rock samples were geologically logged. Geological logging per sample is qualitative in nature. The rock samples reflect a surface point sample and do not represent a total length across the area. Photos of the samples were taken of samples as part of company protocols. This includes taking photographs using

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> The total length and percentage of the relevant intersections logged. 	<ul style="list-style-type: none"> both normal and UV light to define potential tungsten mineralisation
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. 	<ul style="list-style-type: none"> Whole sample processing of the rock samples was completed at the laboratory. No splitting of the samples occurred due to sample weight <3kg. Samples were dried, crushed and pulverised with 85% passing 75 microns Representative samples of outcrop were taken. The rock samples taken by the Company indicate the potential grade variability within the project area. No field duplicates were taken.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (eg. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie. lack of bias) and precision have been established. 	<p>For all Company Rock Samples:</p> <ul style="list-style-type: none"> Rock samples were dried, crushed and pulverised to produce a 50g charge for multielement analysis Multi-element analysis was completed using Triple Quad, Four Acid Super Trace and Four Acid Digest methodologies (ME-MS85), with ICP-MS utilised as the analytical instrument. Samples returning >10,000 ppm W were additionally analysed by XRF (ME-XRF 15B). Gold samples have been submitted to ALS Perth for PhotonAssay, results pending. Photon analysis only requires rock sample to be crushed. The Company uses certified reference material (CRM) for all gold, geochemistry samples at a targeted frequency of 1 every 20 samples. No blank material has been used. No external laboratory checks have occurred. CRM performance falls within acceptable limits of 2 Standard Deviations. <p>For all Company Soil Samples:</p> <ul style="list-style-type: none"> Portable XRF (Olympus Vanta V2MR portable XRF analyser) was calibrated using inbuilt Vanta calibration methodology for each session of XRF analysis. Vanta XRF confirmed it was calibrated to manufacturers specification for each analytical session. Company protocol included testing using portable XRF unit output with CRM material
Verification of sampling and assaying	<ul style="list-style-type: none"> The verification of significant intersections by either independent or alternative company personnel. 	<ul style="list-style-type: none"> Company completed XRF analysis at laboratory for select rock samples including high grade samples

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. 	<ul style="list-style-type: none"> Two batches of soil samples were issued to laboratory for QAQC of XRF results. No field duplicates of rock samples were taken Assay lab duplicate was completed on assays >10000 ppm No field duplicates of soil samples have been taken by the Company. No adjustments have been made to the assay data received by the laboratory.
Location of data points	<ul style="list-style-type: none"> Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	<ul style="list-style-type: none"> The horizontal datum used is GDA 94 and projection is MGA zone 55. The vertical datum is AHD71. Surface topography has been generated using high resolution LiDAR survey completed by the Company in October 2023. The surface topography has been used to improve elevations of the sample data. Handheld GPS unit has been used to determine location with an estimated accuracy of +/- 5m.
Data spacing and distribution	<ul style="list-style-type: none"> Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied. 	<ul style="list-style-type: none"> Soil samples were completed on a nominal 200m x 200m grid in a recently planted pine forest Rock samples were collected as part of completing soil grid and where outcrop was located Limited rock out crop occurs at surface resulting in data spacing is clustered and not evenly distributed across the surface. This program traversed a recently planted pine forest No drilling has occurred at the project. The distribution of sampling is limited to the surface distribution of W, Bi, Mo and associated path finder elements and is not used for Mineral Resource and Ore Reserve estimations. No sample compositing has been applied. Rock samples reflect point sampling at surface.
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	<ul style="list-style-type: none"> Soil samples were collected on a nominal 200m x 200m square patten. Rock samples reflect reconnaissance along roads and in forest area where outcrop / subcrop was located Mineralisation system is hosted within dominantly granodiorite intrusive package. Sheeted quartz and quartz tourmaline veins up to 40 cm width have been mapped to extend over tens of meters in strike within alteration and sheared package. Intense zones as observed range from a 20m to 70m width. Vein systems trend between 230 deg to 280 deg within a quasi-circular shaped tungsten soil anomaly, which is interpreted to be ringed by molybdenum

Criteria	JORC Code explanation	Commentary
		soil results. Pegmatite veins common and work is progressing to understand relationships. Work by CODES has defined metal zonation in the Blue Prospect area based on review of outcrop and geochemistry.
Sample security	<ul style="list-style-type: none"> The measures taken to ensure sample security. 	<ul style="list-style-type: none"> The Company maintains a chain of custody of all samples from collection through to laboratory submission.
Audits or reviews	<ul style="list-style-type: none"> The results of any audits or reviews of sampling techniques and data. 	<ul style="list-style-type: none"> CODES have visited sites in Blue Prospect in February 2026 and independently verified tungsten minerals. Samples collected by CODES are currently being analysed to define mineralisation system characteristics

Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<ul style="list-style-type: none"> The tenement EL9028 is 100% owned by Right Resources Ltd in New South Wales, Australia. The samples were collected in the Green Hills State Forest (pine) operated by NSW forestry. Historical alluvial mining has been mined in the creeks through the Project Areas.
Exploration done by other parties	<ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> Historic mining work occurred between 1855 and 1954 across the Tumbarumba Gold Fields. The Company has obtained hardcopy reports and maps in relation to this information as part of its historical review in preparation for their current work program. The historic data comprises mine production records from the NSW Mine Registrar. There is no known modern exploration in the Blue Prospect area on EL9028.
Geology	<ul style="list-style-type: none"> Deposit type, geological setting and style of mineralisation. 	<ul style="list-style-type: none"> The broader mineralisation system is interpreted to be reduced intrusive related system.
Drill hole Information	<ul style="list-style-type: none"> A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of 	<ul style="list-style-type: none"> No drilling has occurred across the Blue Prospect on EL9028.

Criteria	JORC Code explanation	Commentary
	the report, the Competent Person should clearly explain why this is the case.	
Data aggregation methods	<ul style="list-style-type: none"> In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg. cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. 	<ul style="list-style-type: none"> No data aggregation or grade cuts, calibrations have occurred.
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg. 'down hole length, true width not known'). 	<ul style="list-style-type: none"> The nature of the potential mineralisation is striking 230 to 260 degrees Surface mapping and rock samples reflected clustered data which has been utilised to determine potential geometry and width of mineralisation.
Diagrams	<ul style="list-style-type: none"> Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	<ul style="list-style-type: none"> For a plan image of the sample distribution across the project area refer to Figure 1, 2 and 5. Only surface point samples have been reported therefore sections are not applicable.
Balanced reporting	<ul style="list-style-type: none"> Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	<ul style="list-style-type: none"> All data presented in this announcement are based on Company Sample data within the Tumbarumba Tenement Areas. Reporting of both low and high grades have been included. Refer to Appendix 2 for reported results.
Other substantive exploration data	<ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	<ul style="list-style-type: none"> The Company completed a high-resolution LiDAR survey in October 2023, followed by surface petrology sampling in 2024 and 2025.
Further work	<ul style="list-style-type: none"> The nature and scale of planned further work (eg. tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	<ul style="list-style-type: none"> The Company will conduct follow-up mapping and systematic rock and soil sampling along the structures hosting the high-grade and anomalous samples within EL9028 to better define the geological architecture and extent of the anomalies.
