

Wandanya High-Grade Mn and Fe Results Continue to Impress

Expansion Drilling Extends Manganese Mineralisation 400m to the South

Highlights

Resource definition drilling continues to confirm **widespread and consistent shallow high-grade manganese and iron intersects across the central section of the Wandanya mineralised footprint, both demonstrating Direct Ship Ore (DSO) potential.**

- Significant manganese results include:
 - **10m @ 35.8% Mn** from 0m including **5m @ 44% Mn** from 5m (WDRC572)
 - **11m @ 32.5% Mn** from 4m including **4m @ 41.9% Mn** from 10m (WDRC654)
 - **9m @ 36.7% Mn** from 0m including **4m @ 45.1% Mn** from 4m (WDRC551)
 - **9m @ 36.5% Mn** from 2m including **4m @ 43.8% Mn** from 7m (WDRC573)
 - **9m @ 36.2% Mn** from 0m including **5m @ 42.1% Mn** from 3m (WDRC558)
 - **9m @ 33.6% Mn** from 0m including **4m @ 40.9% Mn** from 4m (WDRC552)
 - **9m @ 33.2% Mn** from 6m including **3m @ 39.4% Mn** from 12m (WDRC624)
- Significant iron results include:
 - **17m @ 59% Fe** from 1m including **8m @ 61.1% Fe** from 7m (WDRC646)
 - **16m @ 58.5% Fe** from 2m including **8m @ 62.8% Fe** from 7m (WDRC645)
 - **16m @ 57.7% Fe** from 0m including **8m @ 62.7% Fe** from 2m (WDRC632)
 - **15m @ 59.5% Fe** from 0m including **7m @ 62.5% Fe** from 5m (WDRC661)
 - **16m @ 55% Fe** from 0m including **5m @ 60.4% Fe** from 10m (WDRC660)
 - **15m @ 58.3% Fe** from 1m including **6m @ 60.5% Fe** from 10m (WDRC659)
 - **15m @ 57.5% Fe** from 0m including **5m @ 62.7% Fe** from 6m (WDRC545)
- **Expansion drilling extends the manganese mineralised horizon a further 400m to the south of the 3km base case target and remains open to the south for a further 1.4km.**
- **Expansion drilling to the north** encountered manganese and iron mineralisation from broad spaced drilling up to 200m and 500m respectively from the 3km base case target.
- **Drilling to recommence in August to further test the full 9km long mineralised system.**

*BCA Announcement 22/10/25

Australian manganese explorer and developer, Black Canyon Limited (**Black Canyon or the Company**) is pleased to announce the second batch of assay results from resource definition drilling at the Wandanya Project (BCA 100%). Drilling in the central portion of the 3km long base case has continued to report consistent zones of high-grade stratiform manganese and iron mineralisation.

The resource definition drilling has focussed on the 3km long base case footprint (Figure 2) however resource expansion drilling has extended manganese mineralisation 400m to the south and between 200m and 500m to the north for both manganese and iron respectively. The cross-strike mineralisation widths have also been increased with expansion drilling to the east.

Black Canyon's Managing Director Brendan Cummins said:

"I never get tired of looking at high grade manganese and iron intersects from Wandanya and these assay results continue to impress. The continuity and scale of the manganese and iron mineralisation is further confirmed particularly in the central section of the 3km long base case target where some of the thickest and highest grades for both manganese and iron have been previously reported from the initial wide-spaced exploration programs.

"The infill program has replicated these high value zones demonstrating how well this stratiform style of mineralisation holds together.

"Whilst the 3km long base case target remains the key focus, we are pleased to discover additional mineralisation to the south. Resource expansion drilling targeted a 400m long outcropping manganese horizon with down dip mineralisation now confirmed with drilling.

Further to the south, mapping and rock chip results have confirmed outcrops of iron and manganese mineralisation extending over 1.4km, which represents an opportunity to grow the mineralisation footprint.

Results from the northern resource expansion drilling revealed shallow medium grade iron intersects up to 500m from the northern boundary of the 3km long base case target while the manganese horizon was extended a further 200m north and delivered medium grade intersects. Further north we have mapped and sampled a prominent 2.8km long iron enriched ridge which we are keen to drill test over the next few months."

Drill Program Summary

Black Canyon has completed both the resource definition plus the south and north expansion drilling programs at its 100% owned Wandanya high-grade manganese and iron discovery. The company has completed approximately 17,200m of RC drilling for 644 holes with most of the drill hole coverage focussed on the 3km base case target. The resource definition and expansion drill programs have now tested 4.8km of the 9km long mineralised system (Figure 1).

In the resource definition area, the drill density has been reduced to a 50m x 50m regular grid pattern from 200m line spacing with 40m hole centres in the northern and central sections of the 3km base case target. This close spaced drill density is expected to be suitable for Indicated or Measured Mineral Resource Estimates, appropriate for Scoping and Feasibility studies.

The assays reported in this release include 223 holes (WDRC441-WDRC663) totalling 6,802m with an average drill depth of 30m. JORC Table 1 and drill collar information is presented in Appendix 1 and 2. There are approximately 7,200 samples in the laboratory with results expected over the next 4 to 6 weeks (WDRC664 to WDRC929).

Figure 1. Drill purpose plan showing the central area of reported drill results (black outline), previously reported (red outline) within the central 3km long base case resource definition drilling program. Southern and northern resource expansion areas are shown as a blue outline

*Figure 2. RC drill hole being completed (WDRC311') that intersected

Resource Definition Manganese Assay Results

Closer spaced drilling continues to confirm strong grade and geological continuity. The reported drill results from the central zone of the mineralisation are located between northing 7,525,850mN to 7,526,200mN covering approximately 350m of strike and up to 1km cross strike width. Previous 200m spaced drill lines in the central area intersected thick and high-grade intersections of manganese up to 10m thick from surface or close to surface. These results have been confirmed with the resource definition drill assay results.

The footwall of the mineralised horizon is strongly enriched with some single metre intervals assaying over 50% Mn (Figure 2). Down dip manganese intersects support cross-strike widths between 500m and 650m with assays pending for several of the deeper holes drilled to the east.

The shallow, higher-grade mineralisation is associated with manganese oxide, while further to the east the shallow dipping stratabound mineralisation transitions to manganese carbonate at depths between 20m and 25m.

Drill plans and a cross section are presented in Figures 1 to 6. Significant manganese and iron assay results are presented in Table 1 and 2 respectively. All collar and collated assay results for the 223 holes are presented in Appendix 2.

Figure 3. Cross-section 7,526,050mN looking to the north (4x Vertical Exaggeration). Cross-section location presented in Figure 4.

Figure 4. Summary of significant resource and expansion drill intersects.

Iron Assay Results

The resource definition drilling has further highlighted DSO potential of the iron mineralisation discovered at Wandanya. Iron ore drop tower tests completed by the Company has produced a high percentage (74%) lump product, grading 59.7% Fe² which is typically sought after in the market as a premium product.

The central section of the Wandanya footprint has previously identified thick intervals of high-grade Fe which has been repeated with this infill drill program. Multiple drill holes are reported intersecting thicknesses over 10m and up to 17m from surface.

Cross-strike widths range from 150m to 350m along the 1.3km of iron mineralisation delineated within the 3km long base case target. The high-grade mineralisation is dominated by hematite with a lower grade goethite/limonite halo.

Drill plans and a cross section are presented in Figures 1 to 6. Significant manganese and iron assay results are presented in Table 1 and 2 respectively. All collar and collated assay results for the 223 holes are presented in Appendix 2.

Table 2. Significant iron assay results from the reported 223 holes.

Resource Expansion Drill Results

The **Southern Resource Expansion** drill program was successful in extending the mineralisation 400m to the south of the 3km long base target. The program was designed to drill test the manganese horizon that was mapped over 400m strike with most of the new holes drilled intersecting shallow manganese oxide (1 to 20m) and deeper manganese carbonate (20 to 60m).

The assays are pending for these drill holes which are part of the southern resource expansion target and expected in the next 4 to 6 weeks.

The mineralised intervals range between 2m to 5m. The most southern drill hole (WDRC014³) previously drilled by Black Canyon intersected 4m @ 26.3% Mn from 5m including 2m @ 37.4% Mn from 7m which remained open to south prior to the southern resource expansion program. Holes WDRC915 and WDRC927 are located 140m and 400m south of WDRC014 (the previous most southern drill hole).

Selected chip trays and visual manganese oxide estimates are provided in Figure 7 and 8. The collar co-ordinates for holes WDRC915 and WDRC927 are provided in Table 3. The visual estimate log tabulation is in Appendix 3. The Company expects the final assays results for holes WDRC915 and WDRC927 to be received in 4 to 6 weeks.

Table 3. Collar information for holes with visual estimates.

HOLE ID	E_GDA94	N_GDA94	RL	EOH	DIP	AZIMUTH	SUMMARY VISUAL MANGANESE OXIDE INTERSECTION

WDRC927	322801	7523453	401	14	-90	360	4m of Mn Oxide from 6m

Further to the south several intermittent iron enriched outcrops associated with manganese have also been mapped for 1.4km with similar mineralogy and textures to those identified on E46/1407 to the north.

Previously reported⁴ rock chip sample results include **58.3% Mn** (W10009), **52.6% Mn** (W10015), **66.0% Fe** (W10008) and **66.3% Fe** (W10013). A follow-up RC drill program is planned to test the remaining 1.4km of strike with an approved POW and Heritage surveys recently completed.

Cautionary Statement for Visual Estimates

Figure 7, 8 & Appendix 3 contains references to visual results and visual estimates of mineralisation. The Company draws attention to uncertainty in reporting visual results. Visual estimates of mineral abundance should never be considered a proxy or substitute for laboratory analyses where concentrations or grades are the factor of principal economic interest. Visual estimates also potentially provide no information regarding impurities or deleterious physical properties relevant to valuations

The **Northern Resources Expansion** program was completed on a 100m x 50m grid and has tested 1.4km of strike from the 3km long base case target. Mapping in the northern resource expansion area showed iron was more dominant than manganese in outcrop, which is reflected in the manganese and iron drill results. The iron and manganese horizon can broadly be traced between sections but there is a decline in grade and thickness. In part, some of the Fe/Mn sequence was absent potentially due to a structural offset.

Between northings 7,526,900mN to 7,527,100mN a 200m manganese extension was delineated. The cross-strike width grades over the 15% Mn cut off ranged between 100 and 150m.

Significant manganese results from the northern expansion drilling include:

- 3m @ 23.5% Mn from 21m (WDRC477)
- 4m @ 23.7% Mn from 24m (WDRC486)
- 2m @ 27.9% Mn from 29m (WDRC487)
- 3m @ 25% Mn from 12m (WDRC544)

Iron mineralisation was extended up to 500m between sections 7,526,900mN to 7,527,400mN. The mineralisation lacked the continuity typically exhibited in the 3km base case target and showed a wider range of grade variability with iron decreasing as silica content increased.

Significant iron results from the northern expansion drilling include:

- 5m @ 54.1% Fe from 6m (WDRC459)
- 7m @ 52.4% Fe from 2m (WDRC472)
- 5m @ 52.3% Fe from 14m (WDRC473)

A total of 2.8km of outcropping iron enrichment with minor subcropping manganese extends to the north that remains to be drill tested. The Company has completed heritage surveys and has an approved POW to commence drilling this target once the drill rig returns to site.

Next Steps

Awaiting assays from approximately 7,200 samples with results expected over the next 4 to 6 weeks from the completed resource definition program (WDRC664 to WDRC929).

Planned exploration drilling will continue to evaluate the 1.4km and 2.8km targets to the south and north respectively.

Inputs for the maiden Mineral Resource Estimate (MRE) are being collected including LIDAR, DGPS collar pickups and down hole density surveys. The maiden MRE is on track for Q3 2026 and a Scoping Study is scheduled for completion in Q4 2026.

The WA Government Exploration Incentive Scheme (EIS) co-funded detailed gravity survey⁵ is planned to commence in mid-July over the Wandanya discovery to test for deeper manganese targets potentially related to hydrothermal manganese mineralisation

Piloting DMS testwork has been completed on the Blend 1 and 2 manganese composites with the final assays pending.

- ENDS -

This announcement has been approved by the Board of Black Canyon Limited.

⁵ ASX release 1 July 2026 - State Government EIS Funding and Project Update

About Black Canyon

Black Canyon has consolidated a significant land holding over 2,000km² in the underexplored Balfour Manganese Field (BMF) and across the Oakover Basin, in Western Australia.

The Company holds several exploration licenses 100% or under joint venture within the BMF. A Global Mineral Resource (Measured, Indicated & Inferred) of 315 Mt @ 10.5% Mn has been defined across the BMF projects. This MRE comprises 100Mt @ 10.4% Mn (Measured), 173Mt @ 10.2% Mn (Indicated) and 42Mt @ 11.9% Mn (Inferred) – announced to the ASX on 22 October 2025.

The Wandanya Discovery represents a new exploration model on the eastern margin of the Oakover Basin comprising, stratabound high-grade manganese and high-grade iron with significant scale and grade potential.

Manganese continues to have attractive long-term fundamentals where it is essential and non-substitutable in the manufacturing of alloys for the steel industry and a critical mineral in the cathodes of Li-ion batteries.

Black Canyon's Project Locations

Compliance Statements

Reporting of Exploration Results and Previously Reported Information

The information in this report that relates to Exploration Results is based on, and fairly represents, information and supporting documentation reviewed by Mr Brendan Cummins, Managing Director of Black Canyon Limited. Mr Cummins is a member of the Australian Institute of Geoscientists, and he has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity which has been undertaken to qualify as a Competent Person as defined in the 2012 Edition of the “Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves”. Mr Cummins consents to the inclusion in this release of the matters based on the information in the form and context in which they appear. Mr Cummins is a shareholder of Black Canyon Limited.

For further information, please refer to ASX announcements dated 14 February 2023, 27 March 2023, June 1 2023, June 14 2023, June 17 2023, July 14 2023, 23 August 2023, 5 September 2023, 26 September 2023, 12 October 2023, 27 November 2023, 12 December 2023, 26 March 2024, and 1 May 2024, 2 July 2024, 21 August 2024, 25 September 2024, 27 September 2024, 8 October 2024, 18 October 2024, 14 November 2024, 27 November 2024, 4 December 2024, 23 December 2024 and 11 February 2025, 1 April 2025, 16 April 2025, 1 May 2025, 30 June 2025 7 July 2025, 7 August 2025, 27 August 2025, 1 September 2025, 8 October 2025, 28 October 2025 ,10 November 2025, 26 November 2025, 10 December 2025, 17 March, 2026, 8 April 2026, 14 April 2026, 14 May 2026 and 1 July 2026 which are available from the ASX Announcement web page on the Company’s website.

The Company confirms that it is not aware of any new information or data that materially affects the information included in this release that relate to Exploration Results and, in the case of mineral resource estimates, that all material assumptions and technical parameters underpinning the estimates in the relevant release continue to apply and have not materially changed.

APPENDIX 1: JORC 2012: TABLE 1

Section 1 Sampling Techniques and Data		
Criteria	Explanation	Comment
Sampling techniques	<i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> <i>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i>	<i>Reverse circulation ('RC') was used as the primary drilling technique for the projects.</i> <i>RC cuttings were continuously sampled at 1 m intervals. All drill holes were sampled and logged from surface to end of hole or depth of mineralisation.</i> <i>Drilling completed by Black Canyon has been used for the projects.</i> <i>All drill samples were logged for weathering, colour, lithology and mineralogy.).</i> <i>RC samples were collected and placed in marked green plastic bags in order at each collar position.</i> <i>The 1m interval samples are considered industry standard and representative of the material being tested.</i> <i>There was limited water encountered during the drill program.</i> <i>The drilling and sample techniques are considered representative for the style of mineralisation utilising 1m sample intervals</i> <i>The target sample weight was between 2-3kg which is appropriate for the style of mineralisation</i>
Drilling techniques	<i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i>	<i>Black Canyon drilling was completed using RC technique at 90-degree angle to collect 1 m samples as RC chips. Drill diameter is 5.25 inches as per standard RC sizing. A face sampling hammer was used to drill and sample the holes.</i> <i>Impact Drilling was contracted for the 2026 drill program.</i>

<i>Drill sample recovery</i>	<i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	<i>The 2026 drill campaign recorded satisfactory drill sample recovery. The sample weights were not recorded on site, but the samples were weighed once received at the laboratory. The samples weights show good overall recoveries with smaller samples weights recorded in the top 1-2m.</i> <i>During the 2026 drill program the 1m samples were collected from a levelled cone splitter affixed to the side of the drill rig.</i> <i>It is unlikely the lower weights encountered in the top 1 - 2m of the holes has biased the samples particularly with the style of mineralisation.</i> <i>The samples were drilled mostly dry minimising sample bias</i>
<i>Logging</i>	<i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i> <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i> <i>The total length and percentage of the relevant intersections logged.</i>	<i>Geological logs exist for the 2026 drill program.</i> <i>Logging of individual 1 metre intervals was completed using logging code dictionary which recorded weathering, colour, lithology and observed commentary to assist with determining manganese mineralisation.</i> <i>Logging and sampling have been carried out to industry standards by an experienced geologist.</i> <i>Drill holes were geologically logged in their entirety, and a reference set of drill chips were collected in 20m interval chip trays for the drill program. The chip trays were all photographed on site at the end of drilling each hole.</i> Visual Estimates <i>Visual estimates of manganese mineralisation are routinely logged by the site geologist and have been reviewed by the Competent Person</i> A tabulation of the qualitative visual estimates, occurrence and minerals are included in Appendix 3 <i>The visually observed manganese mineralisation reported in holes WDRC915 and WDRC927 are typical, and representative of the mineralisation encountered across the Wandanya discovery. The base of the manganese horizon is massive and typically higher grade ranging between 40 to 55% Mn while the semi-massive mineralisation ranges between 15 and 40% Mn. Low grade manganese is often encountered above and below the mineralised horizon.</i> <i>The assay results for WDRC915 and WDRC927 are expected in the next 4 to 6 weeks.</i> Cautionary Statement <i>Visual estimates of mineral abundance should never be considered a proxy or substitute for laboratory analyses where concentrations or grades are the factor of principal economic interest. Visual estimates also potentially provide no information regarding impurities or deleterious physical properties relevant to valuations.</i>

<i>Sub-sampling techniques and sample preparation</i>	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> <i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i> <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> <i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i> <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	<i>The 1m RC samples were gathered by using a levelled cone splitter of the side of the rig.</i> <i>The samples the subject of this release were submitted to ALS Chemex who dried the sample for 12 hrs and pulverised the entire sample until 85% passing 75µm. This method is considered appropriate to ensure sample representivity</i> <i>The samples were dominantly dry.</i> <i>Black Canyon inserted Certified Reference Material (CRM) at a rate of 1/50, blanks at a rate of 1/50 and field duplicates from the cone splitter at a rate of 1/50 for a total insertion rate of QA/QC materials at 6%</i> <i>The sub sampling technique and quality control procedures is considered appropriate to ensure sample representivity</i> <i>The sample size is considered appropriate for the grainsize and style of mineralisation</i>
<i>Quality of assay data and laboratory tests</i>	<i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i>	<i>The samples were submitted to the primary laboratory – ALS Chemex in Wangara, WA.</i> <i>The 2 – 3kg samples were weighed and dried prior to pulverising 100% of the sample 85% passing 75µm.</i> <i>The sample was then analysed using method ME-XRF26s and ME-GRA05 for manganese and chrome ores using fusion disc XRF for Fe, SiO₂, Mn, Al₂O₃, TiO₂, P₂O₅, S, MgO, K₂O, CaO, CrO₃, TiO₂, Na₂O and BaO.</i> <i>Loss on Ignition (LOI) was also measured by Thermo Gravimetric Analysis (TGA)</i> <i>Review of the quality control results received to date that include CRM, blanks, duplicates show an acceptable level of accuracy (lack of bias) and precision has been achieved.</i> <i>In addition, ALS Chemex has undertaken its own internal QAQC checks using CRM, Blanks and pulp duplicates and no issues have been reported or identified.</i> <i>A selected number of samples will also be submitted to a secondary laboratory for verification</i> <i>The CP is satisfied that the analysis was completed to an acceptable standard in the context in which the results have been reported.</i>

Verification of sampling and assaying	The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data.	Validation of the drilling files (collar, assay and lithology) was undertaken with field and data entry cross checks Adjustment of elemental oxides to primary element was completed using well known conversion factors. There were no twin holes at this stage There has been no adjustment to the assay data
Location of data points	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control.	All drill holes in the project area were surveyed by handheld GPS with an accuracy of +/-5 m. The accuracy of the location of the drill collars is sufficient at this stage of exploration and resource development. The grid system used: GDA94 / UTM zone 51S.
Data spacing and distribution	Data spacing for reporting of Exploration Results. Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied.	The 2026 resource definition drilling completed at Wandanya was conducted via a conventional 50 x 50m drill grid. The drill spacing is sufficient to establish grade and geological continuity for use in the estimation of mineral resources No sample compositing has been applied.
Orientation of data in relation to geological structure	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	At Wandanya the drill lines were oriented east-west across the strike of the primary mineralisation trend. The drill holes were completed at 90 degrees (vertical). At Wandanya the mineralisation is relatively flat lying exhibiting a gentle dip to the east. The drill grid is assumed to be located both perpendicular to the planar orientation of the key mineralised horizon with no or limited bias introduced with respect to the strike or dip of the mineralised horizon.

<i>Sample security</i>	<i>The measures taken to ensure sample security.</i>	<i>The samples were collected into bulka bags, sealed with cable ties and stored on site until the drill program was completed.</i> <i>The samples were then trucked to Newman and then delivered directly to ALS Chemex in Wangara.</i> <i>The bulka bags were inspected and audited by ALS Chemex who did not report any suspicious or tampered samples.</i>
<i>Audits or reviews</i>	<i>The results of any audits or reviews of sampling techniques and data.</i>	<i>No audits or reviews have taken place on the sampling techniques or data</i> <i>The CP was on site for parts of RC drill program and considers the sampling and sub sampling techniques to be equal to industry standard and appropriate for the style of mineralisation and the results being reported</i>

Section 2 – Reporting of Exploration Results

Criteria	Explanation	Comment
<i>Mineral tenement and land tenure status</i>	<i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i> <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i>	<i>The Wandanya mineralisation is located within E46/1407 held 100% by Black Canyon Ltd. Tenement E47/1407 was granted on the 11/04/2022 and expires on 10/04/2027</i> <i>The tenement upon which Wandanya is located are subject to a native title agreement with the Karlka Nyiyaparli Aboriginal Corporation. Multiple site avoidance Archaeologic and Ethnographic heritage surveys have been completed on the Wandanya deposits which has enabled the drilling to be completed. Further Heritage surveys will be required to continue ground disturbing activities beyond the current drill areas.</i> <i>There are no other known impediments to obtaining a licence to operate in the area.</i>
<i>Exploration done by other parties</i>	<i>Acknowledgment and appraisal of exploration by other parties.</i>	<i>No other material historic exploration has been completed on the tenement for manganese on E46/1407.</i> <i>For Wandanya Black Canyon completed a ground reconnaissance exercise in 2023 to map the manganese enrichments and determine down dip upside. The exercise proved significant manganese enrichment throughout the project areas both as outcropping, sub-cropping and as substantial float material. The early reconnaissance groundwork by Black Canyon was used as a basis for the 2023 DDIP survey and the September 2024, June 2025 RC and August 2025 drilling programmes.</i>
<i>Geology</i>	<i>Deposit type, geological setting and style of mineralisation.</i>	<i>The mineralisation model at Wandanya is preliminary but it appears to be a fault related stratabound deposit. There is likely supergene overprint to the original primary mineralisation.</i> <i>The mineralisation is located within a sedimentary sequence. From the base to the top of the sequence the geology comprises footwall dolomite, spotted manganese dolomite, massive manganese and manganese dolomite breccia overlain by hangingwall dolomite. The consistency of the mineralisation down dip and along strike has been</i>

Criteria	Explanation	Comment
		<i>interpreted to represent fault related, tratabound style of manganese mineralisation. Goethite alteration is common above the manganese zone and hematite was logged within the mineralised zones as jaspilitic bands. Manganese intensity increases towards the base of the sequence.</i> <i>The overall geological sequence is dipping very shallowly to the east but is also openly folded with a northerly axial plane forming undulating outcrops. Several large north-easterly faults can be identified along strike associated with surface mineralisation.</i> <i>The hematite iron mineralisation appears to be a thicker up dip lateral equivalent of the manganese, but further drilling and evaluation is required to understand its genesis.</i> <i>The lithological sequence of the Wandanya project principally consists of the overlying Enachedong Formation carbonates overlying the Stag Arrow Formation sediments from the Proterozoic Manganese Group of the southern Oakover Basin. The mineralisation style at Wandanya is stratabound and maybe associated with hydrothermal fluids replacing a suitable reactive host work at the base of the Enachedong Formation. Faults and structure are considered important features of this style of mineralisation with multiple northeast trending faults visible from surface imagery.</i>
<i>Drill hole Information</i>	<i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <i>• easting and northing of the drill hole collar</i> <i>• elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> <i>• dip and azimuth of the hole</i> <i>• down hole length and interception depth</i> <i>• hole length.</i> <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i>	<i>See drill hole location tables, plans and figures in main body of the release and Appendix 2.</i> <i>A listing of drill holes and their corresponding coordinates, elevation and depth are listed in Appendix 2.</i> <i>All drill holes reported that have been finalised and QA/QC checked and approved have been reported in Appendix 2.</i>

Criteria	Explanation	Comment
<i>Data aggregation methods</i>	<i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i> <i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i> <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i>	<i>No grade cutting to assays has been undertaken.</i> <i>Aggregation of samples has been undertaken using simple average calculations for each 1m sample.</i> <i>Manganese intervals have been reported at 15% Mn cut off allowing 1m internal dilution.</i> <i>Iron intervals have been reported at 50% Mn cut off allowing 1m internal dilution.</i> <i>Assays have been reported as elements</i>
<i>Relationship between mineralisation widths and intercept lengths</i>	<i>These relationships are particularly important in the reporting of Exploration Results.</i> <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i>	<i>The Wandanya Prospect is mostly flat lying exhibiting a gentle dip of mineralisation to the east (4 to 6°) and 90° (vertical) drill holes are considered appropriate.</i> <i>The drill results reported are interpreted to represent close to true widths of the mineralisation and are reported as down hole length.</i>
<i>Diagrams</i>	<i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i>	<i>Refer images within the body of this release for further details.</i>
<i>Balanced reporting</i>	<i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	<i>Information considered material to the reader's understanding of the Exploration Results has been reported. in the body of the text and significant results have selectively been reported to provide the reader with the potential tenor and widths of the mineralisation</i> <i>APPENDIX 2- contains the location, drill holes details and assay results as received, and QA/QC approved for the 202 drill program to date.</i> <i>Holes denoted with NSR indicated that no significant mineralisation over 15% Mn was detected in that hole.</i>

Criteria	Explanation	Comment
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	No other substantive exploration has been completed at Wandanya by other exploration parties Black Canyon has completed mapping, rock chip sampling, 3 RC drill programs, 1 diamond drill program (PQ3) and several metallurgical test programs.
Further work	The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	Further RC and Diamond core drilling is required. A DGPS collar pick up and LIDAR survey has been completed for the Mineral Resource Estimate. Down hole density measurements will be collected for the Mineral Resources estimate and compared to density measurements completed on PQ3 core samples (Immersion Method) Gravity surveys are planned for mid July 2026 that might also detect deeper buried mineralisation associated with the underlying sedimentary sequences. Mineral Resource Estimate followed by a Scoping Study

APPENDIX 2: SUMMARY DRILL HOLE COLLAR AND ASSAYS SUMMARIES

HOLE ID	Target	E_GDA94	N_GDA94	RL	EOH	DIP	AZIMUTH	FROM (m)	TO (m)	THICK (m)	Mn (%)	Fe (%)	Drill intersection
WDRC441	Mn	322897	7526750	413.2	32	-90	360	24	28	4	23.5	3.7	4m @ 23.5% Mn & 3.7% Fe from 24m
