28 July 2026

SOUTHERN CROSS GOLD DRILLS 481 METRES OF MINERALIZATION LINKING CHRISTINA TO GOLDEN DYKE IN WESTERNMOST HOLE INCLUDING 0.8 METRES @ 141.0 g/t GOLD

Vancouver, Canada and Melbourne, Australia — Southern Cross Gold Consolidated Ltd **("SXGC", "SX2" or the "Company") (TSX:SXGC) (ASX:SX2) (OTCQX:SXGCF) (Frankfurt: MV3.F)** announces results from five drill holes at the 100%-owned Sunday Creek Gold-Antimony Project in Victoria, comprising the westernmost sequence of holes reported from the main prospect area to date, close to 300 m west of any previous drilling (Figures 1 to 5). Three definition holes tested the upper portion of the Christina prospect and two deep control holes defined the down-dip architecture through Golden Dyke and Rising Sun.

SDDSC235 is the **westernmost hole** released from Christina. The hole remained within prospective dyke and altered sediment for a cumulative 800 m of its 1,405.7 m length, including a zone of mineralization from 282.1 m that returned **481 m @ 0.9 g/t Au (uncut)**, carrying Christina through into the Golden Dyke corridor before defining the prospective corridor within Rising Sun 1,010 m below surface. The hole returned **seven individual assays above 50 g/t Au, up to 496.0 g/t Au**, demonstrating that Christina hosts the same scale of mineralized system as Golden Dyke and Rising Sun.

Best results include a broad intercept of **8.3 m @ 4.8 g/t AuEq** (4.8 g/t Au, 0.0% Sb) from 708.7 m and a high-grade interval of **0.8 m @ 141.0 g/t AuEq** (141.0 g/t Au, 0.0% Sb) from 568.9 m, both in SDDSC235. All three definition holes from the new western pad intersected gold within 15 m to 60 m of surface, defining up to three previously unidentified shallow vein sets, including 2.6 m @ 7.5 g/t AuEq from 40.0 m in SDDSC220. Across the five holes, eight individual Au assays exceeded 50 g/t Au and four individual Sb assays exceeded 10% Sb, up to 39.50% Sb over 0.10 m from 91.79 m in SDDSC235. The true thickness of the mineralized intervals is interpreted to be approximately 40% to 90% of the sampled thickness for all reported holes.

Four High Level Takeaways:

1. Westernmost step-out. SDDSC220, SDDSC232 and SDDSC235 were drilled from a new pad approximately 300 m west of any previously released collar, and all three returned mineralization, confirming the system continues into previously untested ground with shallow gold intersected within 15 m to 60 m of surface.

2. SDDSC235 links Christina and Golden Dyke in a single hole. The westernmost and deepest hole reported from Christina to date intersected 15 vein sets, including **481 m @ 0.9 g/t Au (uncut)** and a high-grade hit of **0.8 m @ 141.0 g/t Au** from 568.9 m, before defining the prospective corridor within Rising Sun 1,010 m below surface. Christina is now demonstrated to host the same mineralized system as Golden Dyke and Rising Sun.

3. High-grade inventory keeps growing as drilling steps out. Five new composite intersections above 100 g/t Au lift the project total to 93, from 88, reinforcing the consistency of high-grade mineralization across an expanding footprint. All intersections form Christina are located outside the March 2025 exploration target.

4. Shallow antimony grades confirm epizonal zonation at Christina. SDDSC235 returned 39.5% Sb over 0.1 m from 91.8 m and SDDSC220 returned 12.4% Sb over 0.2 m from 205.4 m, extending the critical mineral endowment west.

Michael Hudson, President & CEO states: “SDDSC235 is one of the most important holes we have drilled at Sunday Creek. The westernmost hole reported from Christina, it stayed in near-continuous mineralization for 481 m @ 0.9 g/t gold (uncut), delivered individual assays up to 496 g/t gold below the entire Christina prospect.

“This hole shows Christina can deliver at the same scale and grade as Golden Dyke and Rising Sun, and it does so in ground we have only just begun to test. Around it, every definition hole from the new western pad hit gold within 15 to 60 m of surface, close to 300 m west of any previous drilling, while our control holes locked in the architecture that will guide the next phase of definition drilling.

“With eleven rigs turning, 68 holes at the lab and our 200,000 m program running through to Q1 2027, Sunday Creek continues to grow in scale and confidence with every set of results.”

For Those Who Like the Details - Highlights:

- **SDDSC235** - the deepest west to east hole released to date from the Christina prospect, extending through Golden Dyke into the Rising Sun corridor at depth. The hole returned 481 m @ 0.92 g/t AuEq (uncut) (0.87 g/t Au, 0.02% Sb) from 282.1 m, with seven individual assays exceeding 50 g/t Au and one exceeding 35% Sb.
  - **1.6 m @ 21.4 g/t AuEq** (21.3 g/t Au, 0.0% Sb) from 246.5 m,
    - including **0.2 m @ 156.5 g/t AuEq** (156.0 g/t Au, 0.2% Sb) from 246.5 m
  - **0.8 m @ 141.0 g/t AuEq** (141.0 g/t Au, 0.0% Sb) from 568.9 m
  - **8.3 m @ 4.8 g/t AuEq** (4.8 g/t Au, 0.0% Sb) from 708.7 m (Golden Dyke),
    - including **0.4 m @ 43.2 g/t AuEq** (43.2 g/t Au, 0.0% Sb) from 716.7 m
  - **1.8 m @ 37.2 g/t AuEq** (37.2 g/t Au, 0.0% Sb) from 729.5 m (Golden Dyke),
    - **including 0.2 m @ 337.0 g/t AuEq** (337.0 g/t Au, 0.0% Sb) from 731.1 m
  - Individual assays included **496 g/t Au, 337 g/t Au, 192.0 g/t Au, 156 g/t Au, 71.5 g/t Au, 51.4 g/t Au, 51.1 g/t Au, and 2.9 g/t Au and 39.5% Sb.**
- **SDDSC220** - the first hole drilled from a new western drill pad, confirming shallow high-grade mineralization in previously untested westernmost ground, with one individual assay exceeding 10% Sb.
  - **2.6 m @ 7.5 g/t AuEq** (7.5 g/t Au, 0.0% Sb) from 40.0 m, including **1.3 m @ 13.1 g/t AuEq** (13.1 g/t Au, 0.0% Sb) from 40.0 m
  - **0.7 m @ 23.5 g/t AuEq** (13.9 g/t Au, 4.0% Sb) from 205.2 m, including **0.2 m @ 72.4 g/t AuEq** (42.8 g/t Au, 12.4% Sb) from 205.4 m
  - Individual assays included **42.8 g/t Au & 12.40% Sb.**
- **SDDSC232** - followed up high-grade results from SDDSC137W2, intersecting shallow Christina mineralization before the hole deviated off target and concluded at 516.5 m, short of the planned Golden Dyke intercept, with one individual assay exceeding 50 g/t Au.
  - **1.3 m @ 4.1 g/t AuEq** (1.9 g/t Au, 0.9% Sb) from 81.4 m
  - **0.1 m @ 172.2 g/t AuEq** (172.0 g/t Au, 0.1% Sb) from 286.1 m

Continued over page

For Those Who Like the Details - Highlights:

- **SDDSC207 -** drilled as a control hole sub-perpendicular to the main dyke trend, intersecting the main Christina vein set at depth and confirming high-grade gold mineralization in a hole designed only to test structural position.
  - **0.2 m @ 41.7 g/t AuEq** (41.6 g/t Au, 0.0% Sb) from 490.2 m
  - **2.5 m @ 2.7 g/t AuEq** (1.3 g/t Au, 0.6% Sb) from 501.5 m
- **SDDSC213** - drilled as a deep control hole, confirming a 260 m vertical step-down in the dyke position between 660 m and 740 m below surface, informing the architecture for the subsequent phase of definition drilling.
- **Project Totals to Date**
  - 273 drill holes for 130.6 km reported from Sunday Creek since late 2020
  - 93 composite intersections exceeding 100 g/t Au by applying a 1 m (down hole length) @ 5 g/t AuEq lower cut
  - 110 composite intersections exceeding 10% Sb by applying a 1 m (down hole length) @ 5 g/t AuEq lower cut
  - 68 holes pending results currently being processed and analysed, including eleven holes actively being drilled and three abandoned holes, with eleven drill rigs currently operational on the project
  - 200,000 m drill program continuing through to Q1 2027

Drill Hole Discussion

Five drill holes are reported here from the Christina prospect. SDDSC220, SDDSC232 and SDDSC235 were drilled in a west-to-east orientation to optimise intersection angles across the vein architecture, while SDDSC207 and SDDSC213 were drilled sub-perpendicular to the dyke trend as control holes, designed to establish the down-dip architecture of the Christina prospect ahead of the follow-up definition holes along the prospective mineralized corridor. Together, these holes were designed to expand exploration opportunities across the Christina prospect, extending from surface through the Golden Dyke corridor and, in the case of SDDSC235, into Rising Sun at depth.

The five holes comprise three west-to-east definition holes and two deep control holes drilled to confirm the down-dip architecture of Christina ahead of a significant westernmost step-out of known mineralization. SDDSC220, SDDSC232 and SDDSC235 returned shallow high-grade intersections, delivering the first confirmed mineralization across the westernmost, previously untested parts of the prospect, and confirmed that mineralization continues from surface through the Golden Dyke corridor and, in SDDSC235, into the Rising Sun corridor at depth.

Eight (8) individual Au assays greater than 50 g/t Au and four (4) individual Sb assays greater than 10% Sb were intersected amongst the five holes reported, reinforcing the continued high-grade growth in upper Christina as exploration continues to define the boundaries of the mineralization.

These collars are the westernmost sequence of holes released drilling into the main prospect area of Sunday Creek to date, representing close to 300 m western step-out from previously released collar positions.

New shallow mineralization, not previously identified within this sequence of drilling, was intersected in SDDSC220, SDDSC232 and SDDSC235, successfully defining up to three new shallow vein sets within 15 m to 60 m of the surface.

SDDSC207

SDDSC207 was drilled as a control hole, sub-perpendicular to the main dyke trend, and successfully intersected close to 40 m downhole width of **prospective** terrain (Dyke and altered sediments) 350 m below the surface (estimated true width 21 m). Selected composite intervals from this hole, which skimmed the main vein set, demonstrate the prevalence of high-grade gold intersections in the Christina prospect.

Selected composite highlights include:

- 0.2 m @ 41.7 g/t AuEq (41.6 g/t Au, 0.0% Sb) from 490.2 m
- 2.5 m @ 2.7 g/t AuEq (1.3 g/t Au, 0.6% Sb) from 501.5 m

SDDSC213

SDDSC213 was also drilled as a control hole, intersecting 108 m of downhole prospective terrain (estimated true width 42 m). This is of particular importance in defining the position of the dyke structure at depth, where a 260 m vertical step down in the dyke position was identified between 660 m and 740 m below the surface, in an area of very little previous drilling, adjacent to the eastern boundary between the Christina and Golden Dyke prospects. This confirmed the dyke architecture required to inform the subsequent phase of definition drilling.

SDDSC220

SDDSC220 is the shallowest of the three definition holes included in this release and the first hole to be drilled from this western drill pad location, providing the first confirmation of mineralization in the upper westernmost parts of the Christina prospect.

SDDSC220 returned one individual assay exceeding 10% antimony:

- **12.40% Sb** & 42.8 g/t Au over 0.20 m from 205.39 m

Selected composite highlights include:

  - **2.6 m @ 7.5 g/t AuEq (7.5 g/t Au, 0.0% Sb) from 40.0 m,** including:
    - 1.3 m @ 13.1 g/t AuEq (13.1 g/t Au, 0.0% Sb) from 40.0 m
  - **0.7 m @ 23.5 g/t AuEq (13.9 g/t Au, 4.0% Sb) from 205.2 m,** including
    - 0.2 m @ 72.4 g/t AuEq (42.8 g/t Au, 12.4% Sb) from 205.4 m
  - **3.6 m @ 6.2 g/t AuEq (5.4 g/t Au, 0.4% Sb) from 244.1 m,** including:
    - 1.0 m @ 16.1 g/t AuEq (15.9 g/t Au, 0.1% Sb) from 244.1 m

SDDSC232

SDDSC232 was designed to follow up high-grade results from SDDSC137W2 (refer to ASX announcement titled 'SXG Drills 1.7 m @ 250.8 g/t Au, 260 m stepout at Christina' dated 28 October 2024) and extend testing toward the Golden Dyke corridor at depth. Deviation in the lower part of the hole caused it to track away from the target corridor, and drilling concluded at 516.5 m, short of the planned 1,000 m, prior to reaching Golden Dyke.

SDDSC232 intersected one individual assay exceeding 50 g/t Au:

- **172.0 g/t Au** & 0.07% Sb over 0.13 m from 286.06 m

The selected composite results from SDDSC232 relate solely to the Christina prospect, as drilling concluded before testing the Golden Dyke corridor:

- **1.3 m @ 4.1 g/t AuEq (1.9 g/t Au, 0.9% Sb) from 81.4 m**
- **4.3 m @ 1.7 g/t AuEq (1.3 g/t Au, 0.2% Sb) from 121.6 m**
- **0.1 m @ 172.2 g/t AuEq (172.0 g/t Au, 0.1% Sb) from 286.1 m**

SDDSC235

SDDSC235 is a milestone hole for Sunday Creek: the westernmost and deepest hole released from the Christina prospect to date. SDDSC235 was collared within the Christina prospect, drilled through Golden Dyke intersecting 15 vein sets in these prospects and continued on to define the position of the prospective corridor within Rising Sun, 1,010 m below the surface. The hole remained within the prospective dyke and altered sediment package for a cumulative 800 m of its 1,405.7 m length, including a single **481 m zone** of near-continuous mineralized prospective terrain from 282.1 m to 763 m which **returned 0.87 g/t Au and 0.02% Sb (0.92 g/t AuEq) (uncut)**. This continuity of mineralization demonstrates that Christina hosts the same scale of mineralized system as Golden Dyke and Rising Sun. The success of SDDSC235 can be attributed to understanding the architecture of the prospective terrain, defined by drilling SDDSC207 and SDDSC213, and previously released deep control hole SDDSC194W1 (refer to ASX announcement 'Southern Cross Gold drills deepest hole, Gold hit 460m below Golden Dyke' dated 9 April 2026).

SDDSC235 intersected seven individual assays exceeding 50 g/t Au, highlighting the high-grade nature of the mineralization encountered along the hole:

- **156.0 g/t Au** & 0.19% Sb over 0.21 m from 246.50 m
- **192.0 g/t Au** & 0.00% Sb over 0.29 m from 552.49 m
- **496.0 g/t Au** & 0.01% Sb over 0.20 m from 569.32 m
- **71.5 g/t Au** & 0.00% Sb over 0.16 m from 569.52 m
- **51.4 g/t Au** & 0.02% Sb over 0.10 m from 684.81 m
- **51.1 g/t Au** & 0.01% Sb over 0.20 m from 714.80 m
- **337.0 g/t Au** & 0.01% Sb over 0.20 m from 731.10 m

SDDSC235 returned one individual assay exceeding 35% antimony, again highlighting the high antimony presence in the shallow part of the system:

- **39.50% Sb** & 2.9 g/t Au over 0.10 m from 91.79 m

Selected composite highlights from Christina include:

- **4.7 m @ 4.9 g/t AuEq (1.2 g/t Au, 1.5% Sb) from 90.4 m**
    - **2.9 m @ 6.1 g/t AuEq (2.4 g/t Au, 1.5% Sb) from 108.8 m,** including
        - 0.9 m @ 16.7 g/t AuEq (6.0 g/t Au, 4.5% Sb) from 110.8 m
    - **1.6 m @ 21.4 g/t AuEq (21.3 g/t Au, 0.0% Sb) from 246.5 m,** including:
        - 0.2 m @ 156.5 g/t AuEq (156.0 g/t Au, 0.2% Sb) from 246.5 m
- **2.8 m @ 4.3 g/t AuEq (2.3 g/t Au, 0.8% Sb) from 286.2 m**
- **2.1 m @ 28.2 g/t AuEq (28.2 g/t Au, 0.0% Sb) from 550.7 m,** including
    - 0.3 m @ 192.0 g/t AuEq (192.0 g/t Au, 0.0% Sb) from 552.5 m
- **0.8 m @ 141.0 g/t AuEq (141.0 g/t Au, 0.0% Sb) from 568.9 m**

With selected composite highlights extending into the Golden Dyke corridor:

- **0.4 m @ 36.3 g/t AuEq (36.3 g/t Au, 0.0% Sb) from 604.8 m**
    - **8.3 m @ 4.8 g/t AuEq (4.8 g/t Au, 0.0% Sb) from 708.7 m,** including
        - 0.4 m @ 43.2 g/t AuEq (43.2 g/t Au, 0.0% Sb) from 716.7 m
    - **1.8 m @ 37.2 g/t AuEq (37.2 g/t Au, 0.0% Sb) from 729.5 m,** including
        - 0.2 m @ 337.0 g/t AuEq (337.0 g/t Au, 0.0% Sb) from 731.1 m

Pending Results and Update

Eleven drill rigs are currently operational on the Sunday Creek project. Results are pending from **68 holes currently being processed and analyzed** including eleven holes that are actively being drilled and three abandoned holes (Figure 2). The Company's 200,000 m drill program continues through to Q1 2027.

About Sunday Creek

The Sunday Creek epizonal-style gold project is located 60 km north of Melbourne within 16,900 hectares ("Ha") of granted exploration tenements. SXGC is also the freehold landholder of 1,392 Ha that forms the key portion in and around the main drilled area at the Sunday Creek Project.

Gold and antimony form in a relay of vein sets that cut across a steeply dipping zone of intensely altered rocks (the "host"). These vein sets are like a "Golden Ladder" structure where the main host extends between the side rails deep into the earth, with multiple cross-cutting vein sets that host the gold forming the rungs. At Apollo, Golden Dyke and Rising Sun these individual 'rungs' have been defined over 600 m depth extent from surface to over 1,200 m below surface, are 2.5 m to 3.5 m wide (median widths) (and up to 10 m), and 20 m to 100 m in strike.

Cumulatively, 273 drill holes for 130,610.13 m have been reported from Sunday Creek since late 2020. This amount includes five holes for 929 m that have been drilled for geotechnical purposes and 22 holes for 2,972.92m that were abandoned due to deviation or hole conditions. Fourteen drill holes for 2,382.74 m have been reported regionally outside of the main Sunday Creek drill area with seventeen (17) additional regional holes currently being processed. A total of 64 historic drill holes for 5,599 m were completed from the late 1960s to 2008. The project now contains a total of **ninety-three (93) composite intersections exceeding 100 g/t Au** and seventy-nine (79) composite intersections between 50 g/t and 100 g/t Au, and **one-hundred and ten (110) composite intersections exceeding 10% Sb** by applying a 1 m (down hole length) @ 5 g/t AuEq lower cut.

Southern Cross Gold's systematic drill program is strategically targeting these significant vein formations, which are currently drill defined over 1,550 m strike of the host dyke/sediment ("rails of the ladder") from Christina to Apollo prospects, of which approximately 650 m has been more intensively drill tested (Golden Dyke to Apollo). At least 124 'rungs' have been defined to date, defined by high-grade intercepts (20 g/t Au to >7,330 g/t Au) along with lower grade edges. Ongoing step-out drilling is aiming to uncover the potential extent of this mineralized system (Figure 2).

Geologically, the project is located within the Melbourne Structural Zone in the Lachlan Fold Belt. The regional host to the Sunday Creek mineralization is an interbedded turbidite sequence of siltstones and minor sandstones metamorphosed to sub-greenschist facies and folded into a set of open north-west trending folds.

Further Information

Further discussion and analysis of the Sunday Creek project is available through the interactive Vrify 3D animations, presentations and videos all available on the SXGC website. These data, along with an interview on these results with President & CEO/Managing Director Michael Hudson can be viewed at www.southerncrossgold.com.

No upper gold grade cut is applied in the averaging and intervals are reported as drill thickness. However, during future Mineral Resource studies, the requirement for assay top cutting will be assessed. The Company notes that due to rounding of assay results to one significant figure, minor variations in calculated composite grades may occur.

Figures 1 to 5 show project location, plan and longitudinal views of drill results reported here and Tables 1 to 3 provide collar and assay data. The true thickness of the mineralized intervals reported individually as estimated true widths ("ETW"), otherwise they are interpreted to be approximately 40% to 90% of the sampled thickness for other reported holes. Lower grades were cut at 1.0 g/t AuEq lower cutoff over a maximum width of 2 m with higher grades cut at 5.0 g/t AuEq lower cutoff over a maximum of 1 m width.

Critical Metal Epizonal Gold-Antimony Deposits

Sunday Creek (Figure 5) is an epizonal gold-antimony deposit formed in the late Devonian (like Fosterville, Costerfield and Redcastle), 60 million years later than mesozonal gold systems formed in Victoria (for example Ballarat and Bendigo). Epizonal deposits are a form of orogenic gold deposit classified according to their depth of formation: epizonal (<6 km), mesozonal (6 km to 12 km) and hypozonal (>12 km).

Epizonal deposits in Victoria often have associated high levels of the critical metal, antimony, and Sunday Creek is no exception. China claims a 56 per cent share of global mined supplies of antimony, according to a 2023 European Union study. Antimony features highly on the critical minerals lists of many countries including Australia, the United States of America, Canada, Japan and the European Union. Australia ranks seventh for antimony production despite all production coming from a single mine at Costerfield in Victoria, located nearby to all SXGC projects. Antimony alloys with lead and tin which results in improved properties for solders, munitions, bearings and batteries. Antimony is a prominent additive for halogen-containing flame retardants. Adequate supplies of antimony are critical to the world's energy transition, and to the high-tech industry, especially the semi-conductor and defence sectors where it is a critical additive to primers in munitions.

Antimony represents approximately 21% to 24% in situ recoverable value of Sunday Creek at an AuEq of 2.39 ratio.

About Southern Cross Gold Consolidated Limited (TSX:SXGC) (ASX:SX2) (OTCQX:SXGCF) (Frankfurt: MV3.F)

Southern Cross Gold Consolidated Ltd. (TSX: SXGC, ASX: SX2, OTCQX: SXGCF), is defining a leading gold-antimony project at the Sunday Creek Gold-Antimony Project, located 60 km north of Melbourne. Sunday Creek is a significant gold and antimony drill discovery in a Tier 1 location, with high-grade drill results including 93 composite intersections exceeding 100 g/t Au from 136.2 km of drilling (including historic drilling). The mineralization follows a "Golden Ladder" structure over 12 km of interpreted strike length, with structures drill tested from surface to 1,200 m depth.

Sunday Creek's strategic value is enhanced by its dual-metal profile. The Company has a critical mineral the Western world needs. This has gained increased significance following China's export restrictions on antimony, a critical metal for defence and semiconductor applications. Southern Cross' inclusion in the US Defense Industrial Base Consortium (DIBC) and Australia's AUKUS-related legislative changes position it as a potential key Western antimony supplier.

Technical fundamentals further strengthen the investment case, with preliminary metallurgical work showing non-refractory mineralization suitable for conventional processing and gold recoveries of 93% to 98% through gravity and flotation.

With a strong cash position, 1,392 Ha of strategic freehold land ownership, and a large 200 km drill program planned through Q1 2027, SXGC is well-positioned to advance this globally significant gold-antimony discovery in a tier-one jurisdiction, delivering milestone by milestone.

NI 43-101 Technical Background and Qualified Person

Kenneth Bush, Head of Exploration for SXGC, a Member of Australian Institute of Geoscientists and a Registered Professional Geologist in the fields of Mining and Exploration (#10315), is the Qualified Person as defined by the NI 43-101. They have prepared, reviewed, verified and approved the technical contents of this release.

Analytical samples are transported to the Bendigo facility of On Site Laboratory Services ("On Site") which operates under both an ISO 9001 and NATA quality systems. Samples were prepared and analyzed for gold using the fire assay technique (PE01S method; 25 gram charge), followed by measuring the gold in solution with flame AAS equipment. Samples for multi-element analysis (BM011 and over-range methods as required) use aqua regia digestion and ICP-MS analysis. The QA/QC program of Southern Cross Gold consists of the systematic insertion of certified standards of known gold content, blanks within interpreted mineralized rock and quarter core duplicates. In addition, On Site inserts blanks and standards into the analytical process.

SXGC considers that both gold and antimony that are included in the gold equivalent calculation ("AuEq") have reasonable potential to be recovered and sold at Sunday Creek, given current geochemical understanding, historic production statistics and geologically analogous mining operations. Historically, ore from Sunday Creek was treated onsite or shipped to the Costerfield mine, located 54 km to the northwest of the project, for processing during WW1. The Costerfield mine corridor, now owned by Alkane Resources (previously Mandalay Resources) contains two million ounces of equivalent gold (Mandalay Resources Q3 2021 Results), and in 2020 was the sixth highest-grade global underground mine and a top 5 global producer of antimony.

SXGC considers that it is appropriate to adopt the same gold equivalent variables as Mandalay Resources Ltd in its 2024 End of Year Mineral Reserves and Resources Press Release, dated February 20, 2025. The gold equivalence formula used by Mandalay Resources was calculated using Costerfield's 2024 production costs, using a gold price of US$2,500 per ounce, an antimony price of US$19,000 per tonne and 2024 total year metal recoveries of 91% for gold and 92% for antimony, and is as follows:

$$AuEq = Au\ (g/t) + 2.39 \times Sb\ (\%)$$

Based on the latest Costerfield calculation and given the similar geological styles and historic toll treatment of Sunday Creek mineralization at Costerfield, SXGC considers that a $AuEq = Au\ (g/t) + 2.39 \times Sb\ (\%)$ is appropriate to use for the initial exploration targeting of gold-antimony mineralization at Sunday Creek.

JORC Competent Person Statement

Information in this announcement that relates to new exploration results contained in this report is based on information compiled by Mr Kenneth Bush a Member of Australian Institute of Geoscientists and a Registered Professional Geologist in the fields of Mining and Exploration (#10315). Mr Bush has sufficient experience relevant to the style of mineralization and type of deposit under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Bush is Head of Exploration of Southern Cross Gold Consolidated Limited and consents to the inclusion in the report of the matters based on their information in the form and context in which it appears.

Certain information in this announcement that relates to prior exploration results is extracted from the Independent Geologist's Report dated 11 December 2024 which was issued with the consent of the Competent Person, Mr Steven Tambanis. The report is included in the Company's prospectus dated 11 December 2024 and is available at www.asx.com.au under code "SX2". The Company confirms that it is not aware of any new information or data that materially affects the information related to exploration results included in the original market announcement. The Company confirms that the form and context of the Competent Persons' findings in relation to the report have not been materially modified from the original market announcement.

Certain information in this announcement also relates to prior drill hole exploration results, extracted from the following announcements, which are available to view on www.southerncrossgold.com:

- 4 October, 2022 SDDSC046, 20 October, 2022 SDDSC049, 5 September, 2023 SDDSC077B, 12 October, 2023 SDDLV003 & 4, 23 October, 2023 SDDSC082, 9 November, 2023 SDDSC091, 14 December, 2023 SDDSC092, 5 March, 2024 SDDSC107, 30 May, 2024 SDDSC117, 13 June, 2024 SDDSC118, 5 September, 2024 SDDSC130, 28 October, 2024 SDDSC137W2, 28 November, 2024 SDDSC141, 9 December, 2024 SDDSC145, 18 December, 2024 SDDSC129 & 144, 28 May, 2025 SDDSC161, 16 June, 2025 SDDSC162, 26 August, 2025 SDDSC171, 8 September, 2025 SDDSC170A, 9 April, 2026 SDDSC194W1

The Company confirms that it is not aware of any new information or data that materially affects the information included in the original document/announcement and the Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcement.

Forward-Looking Statement

This news release contains forward-looking statements. Forward-looking statements involve known and unknown risks, uncertainties and assumptions and accordingly, actual results and future events could differ materially from those expressed or implied in such statements. You are hence cautioned not to place undue reliance on forward-looking statements. All statements other than statements of present or historical fact are forward-looking statements. Forward-looking statements include words or expressions such as “proposed”, “will”, “subject to”, “near future”, “in the event”, “would”, “expect”, “prepared to” and other similar words or expressions. Factors that could cause future results or events to differ materially from current expectations expressed or implied by the forward-looking statements include general business, economic, competitive, political, social uncertainties; the state of capital markets, unforeseen events, developments, or factors causing any of the expectations, assumptions, and other factors ultimately being inaccurate or irrelevant; and other risks described in the Company’s documents filed with Canadian or Australian (under code SX2) securities regulatory authorities. You can find further information with respect to these and other risks in filings made by the Company with the securities regulatory authorities in Canada or Australia (under code SX2), as applicable, and available for the Company in Canada at www.sedarplus.ca or in Australia at www.asx.com.au (under code SX2). Documents are also available at www.southerncrossgold.com The Company disclaims any obligation to update or revise these forward-looking statements, except as required by applicable law.

Figure 1: Sunday Creek plan view showing selected results from holes SDDSC207, SDDSC213, SDDSC220, SDDSC232 and SDDSC235 reported here (dark blue highlighted box, black trace), with selected prior reported drill holes.

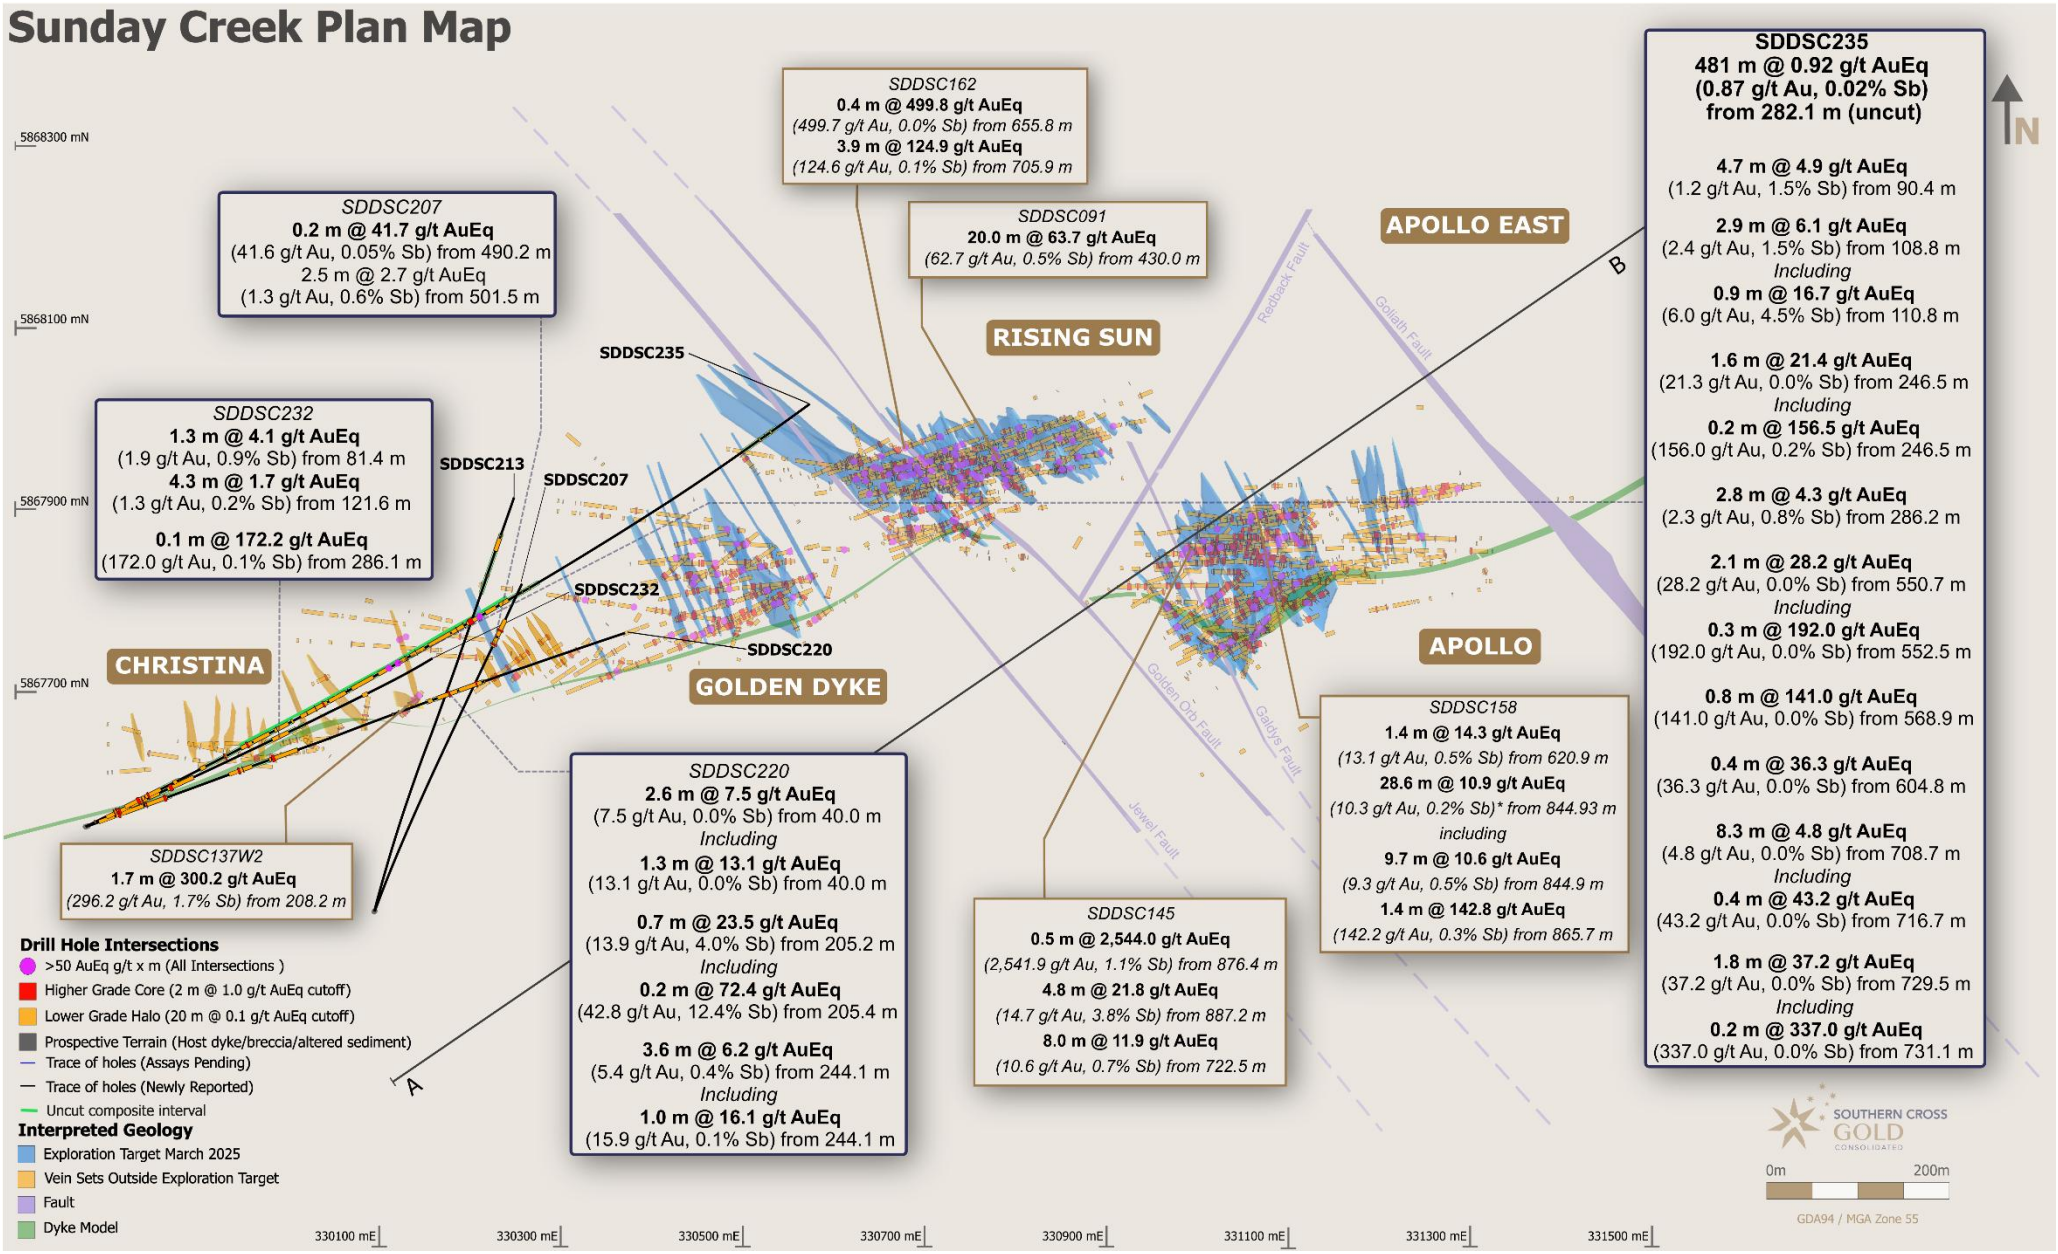

Figure 2: Sunday Creek plan view showing selected drill hole traces from holes SDDSC207, SDDSC213, SDDSC220, SDDSC232 and SDDSC235 reported here (black trace), with prior reported drill holes (grey trace) and currently drilling and assays pending hole traces (dark blue).

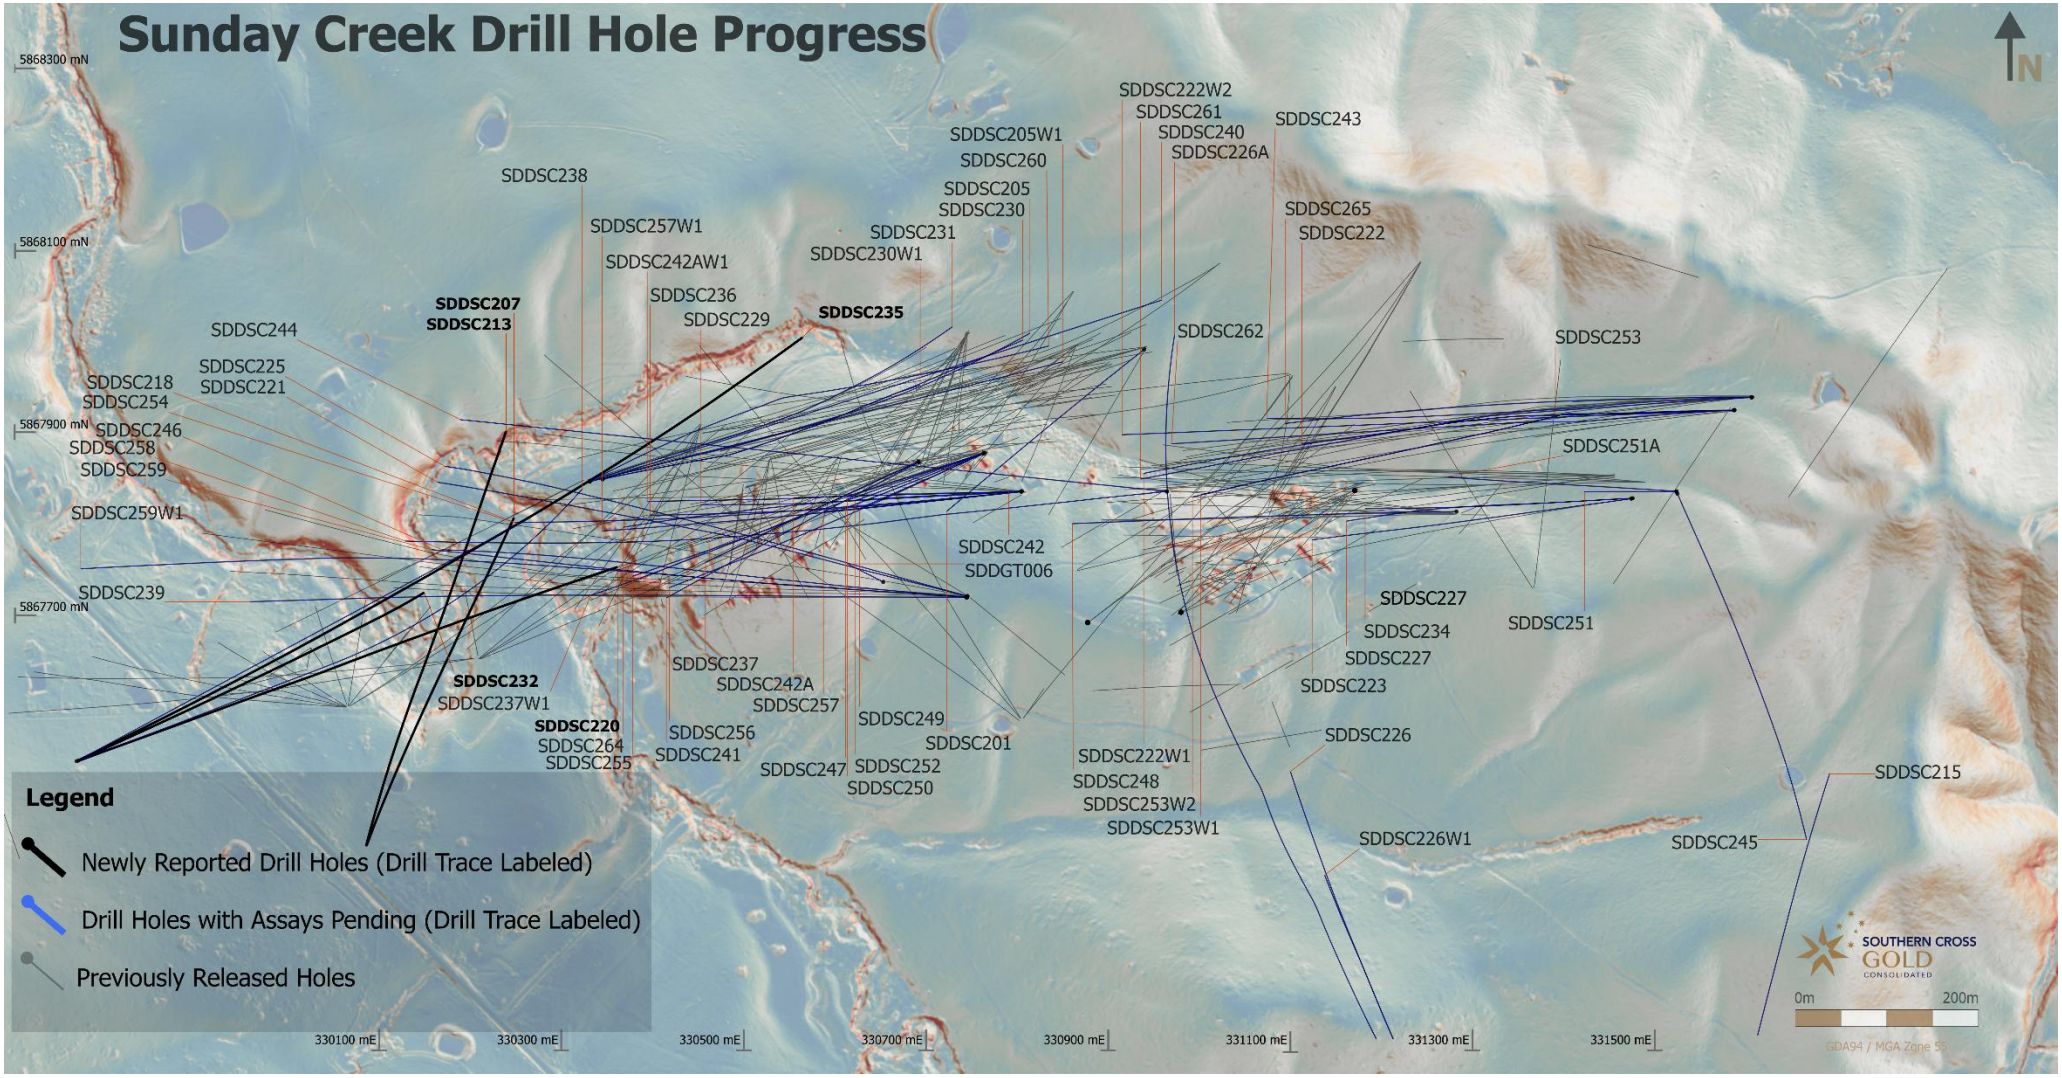

Figure 3: Sunday Creek longitudinal section across A-B in the plane of the dyke breccia/altered sediment host looking towards the NW (striking 56 degrees) indicating mineralized vein sets. Showing holes SDDSC207, SDDSC213, SDDSC220, SDDSC232 and SDDSC235 reported here (dark blue highlighted box, black trace), with selected intersections and prior reported drill holes. The vertical extents of the vein sets are limited by proximity to drill hole pierce points.

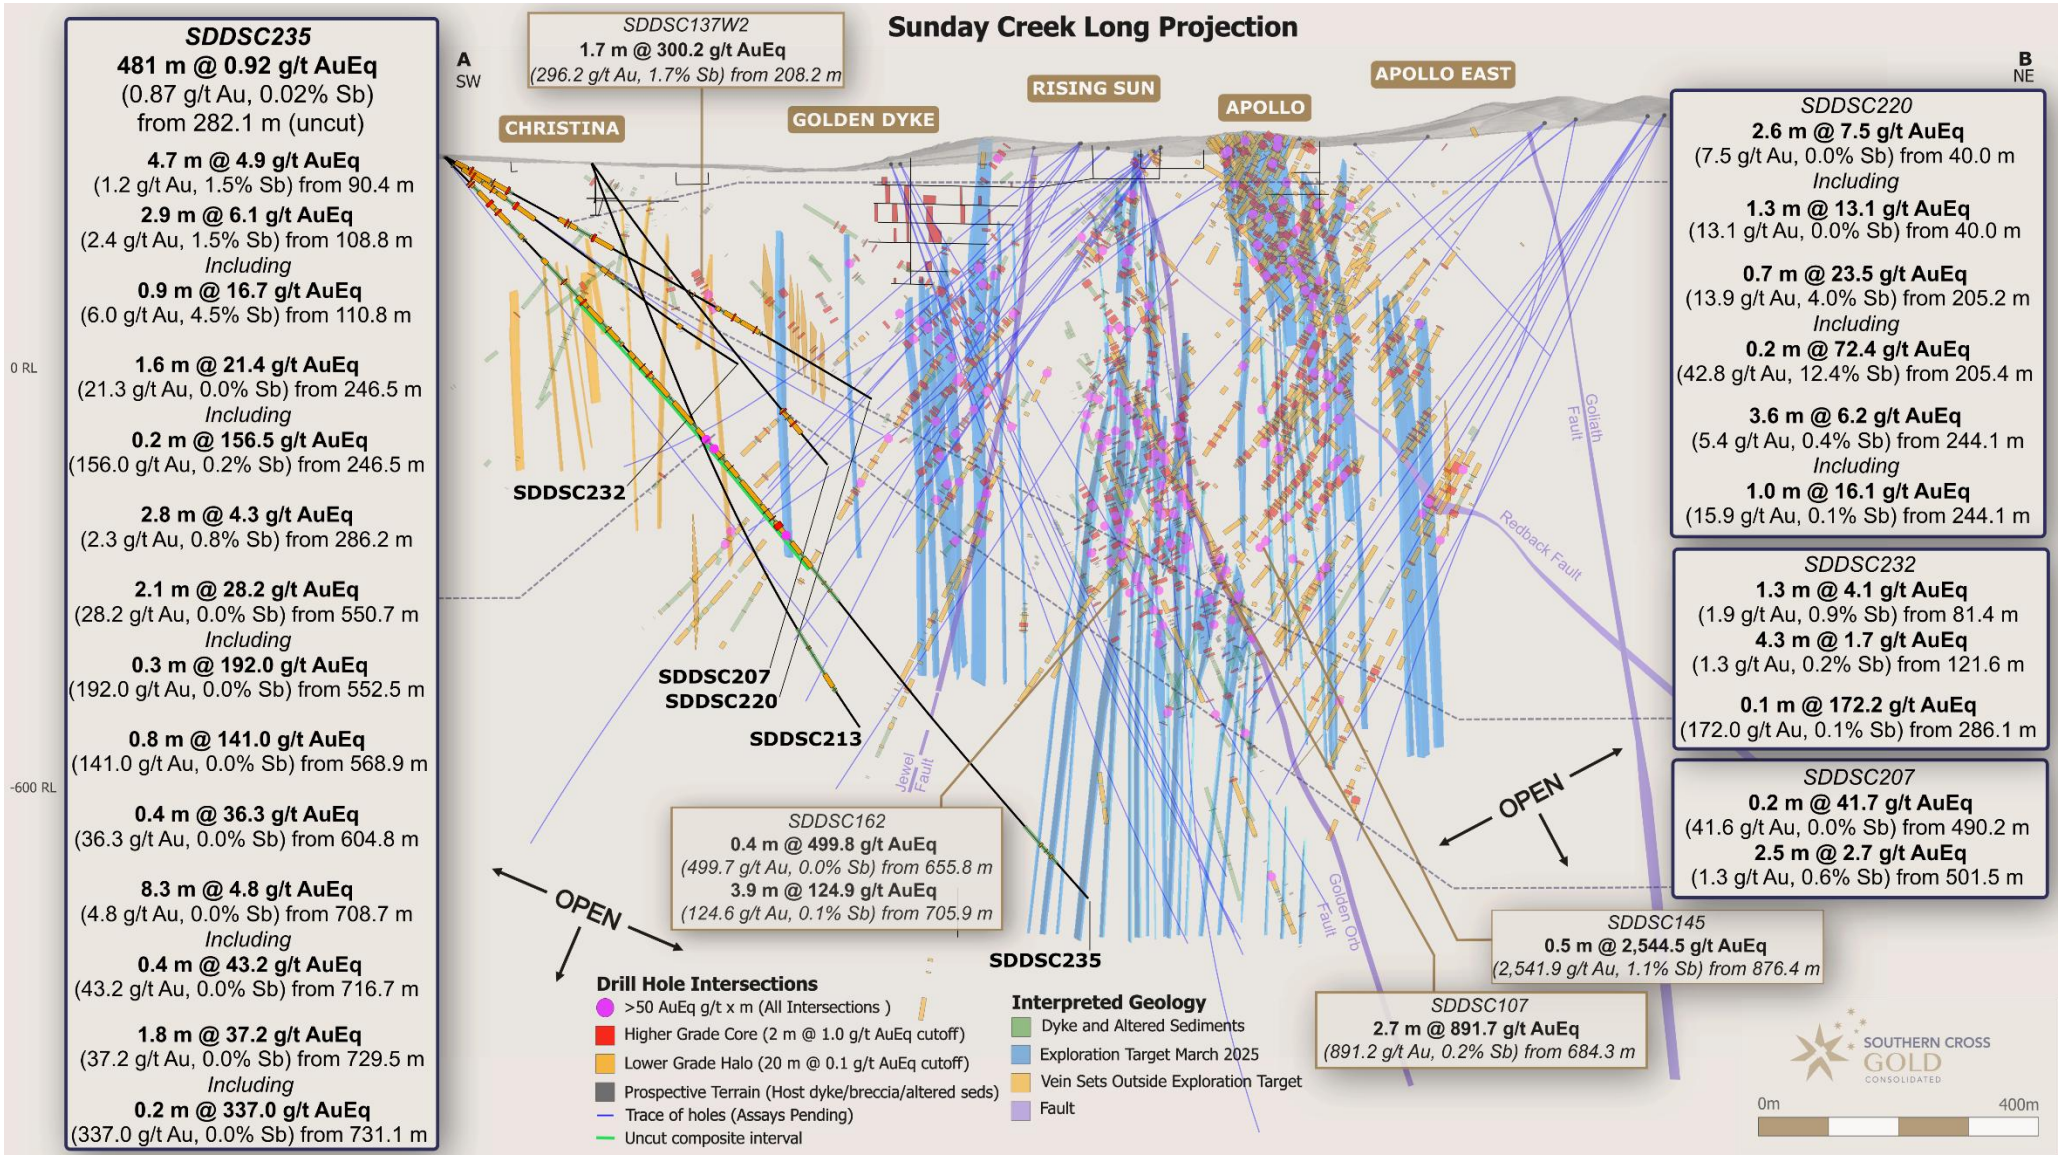

Figure 4: Sunday Creek regional plan view showing soil sampling, structural framework, regional historic epizonal gold mining areas and broad regional areas. The main regional drill areas are at Tonstal, Consols and Leviathan located 4,000 m to 7,500 m along strike from the main drill area at Golden Dyke- Apollo. Map in GDA94/ MGA Zone 55.

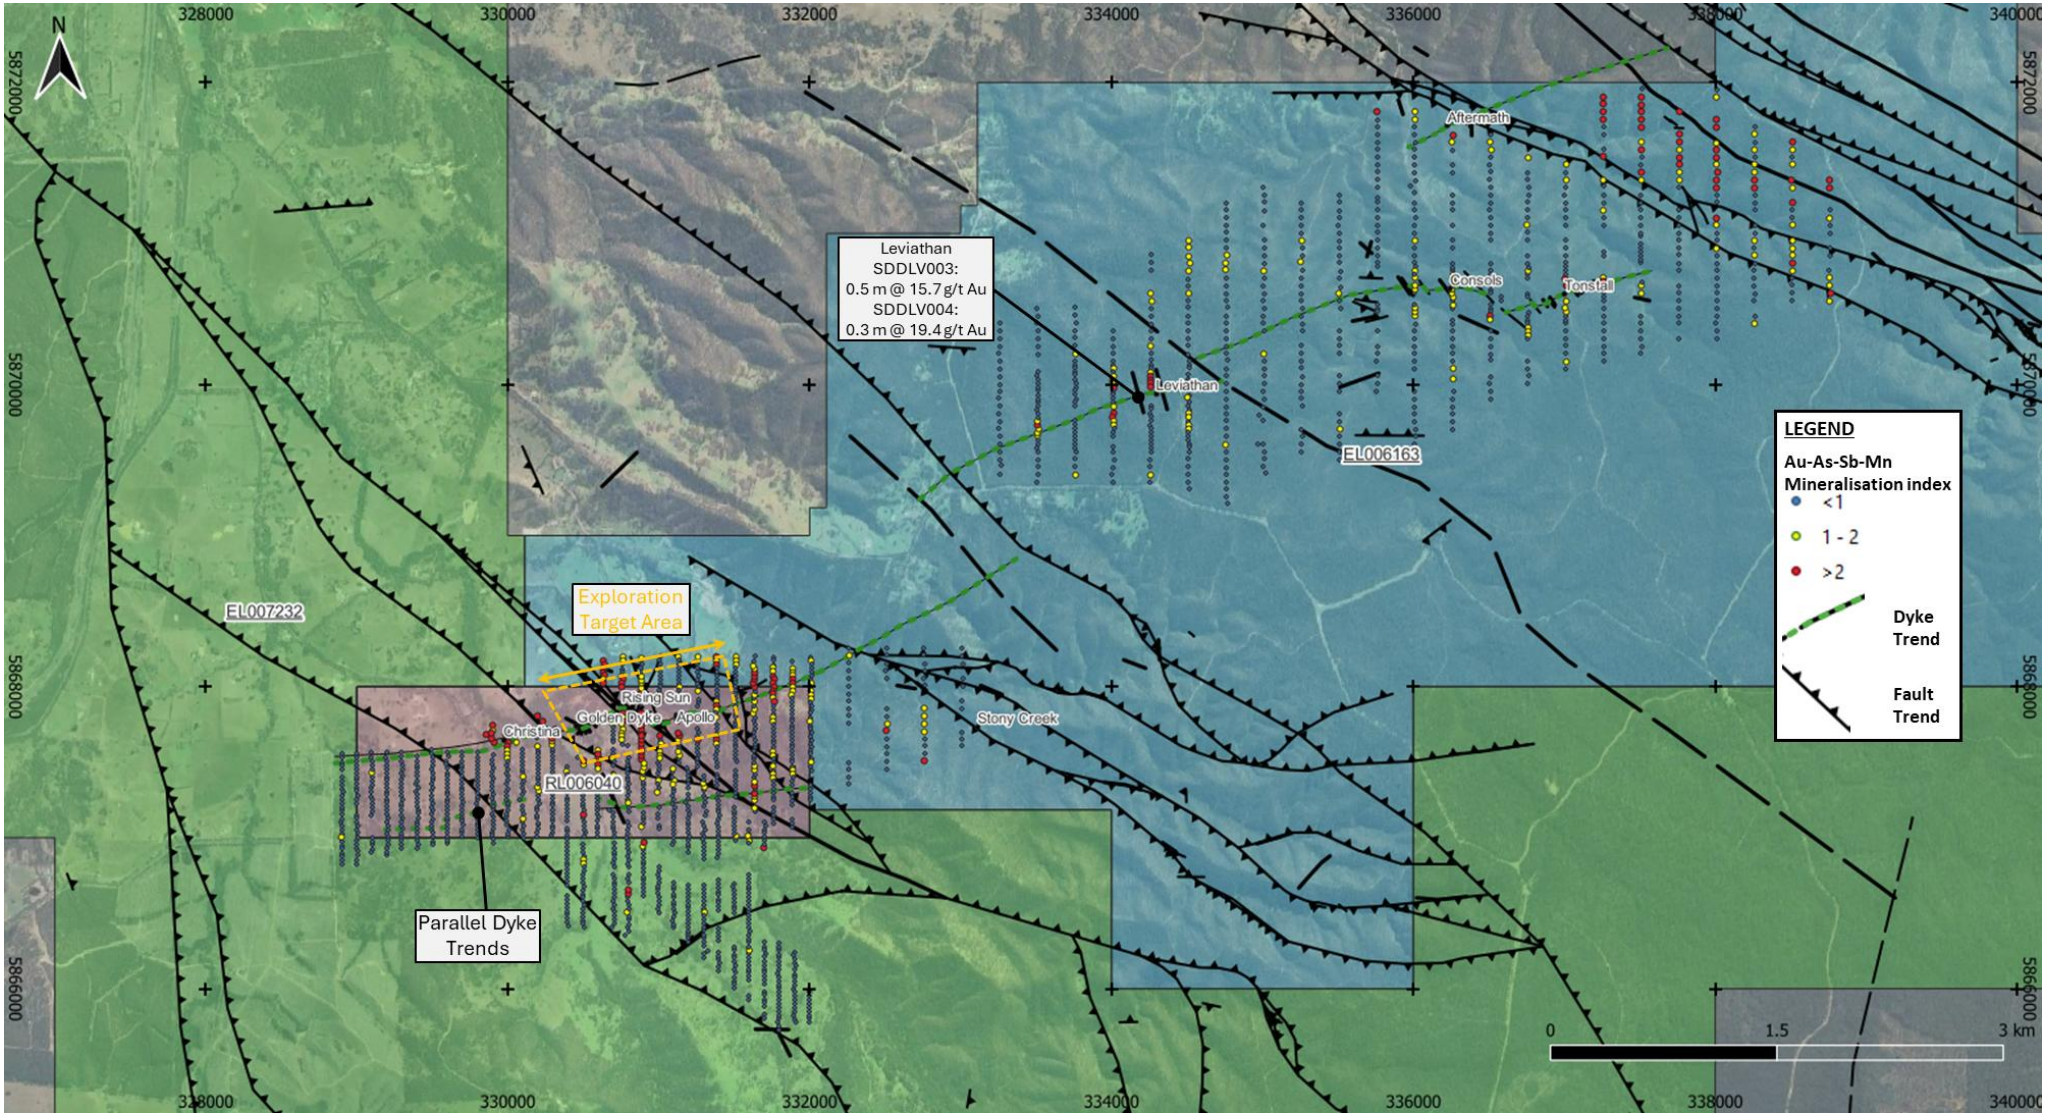

Figure 5: Location of the Sunday Creek project, along with the 100% owned Redcastle Gold-Antimony Project

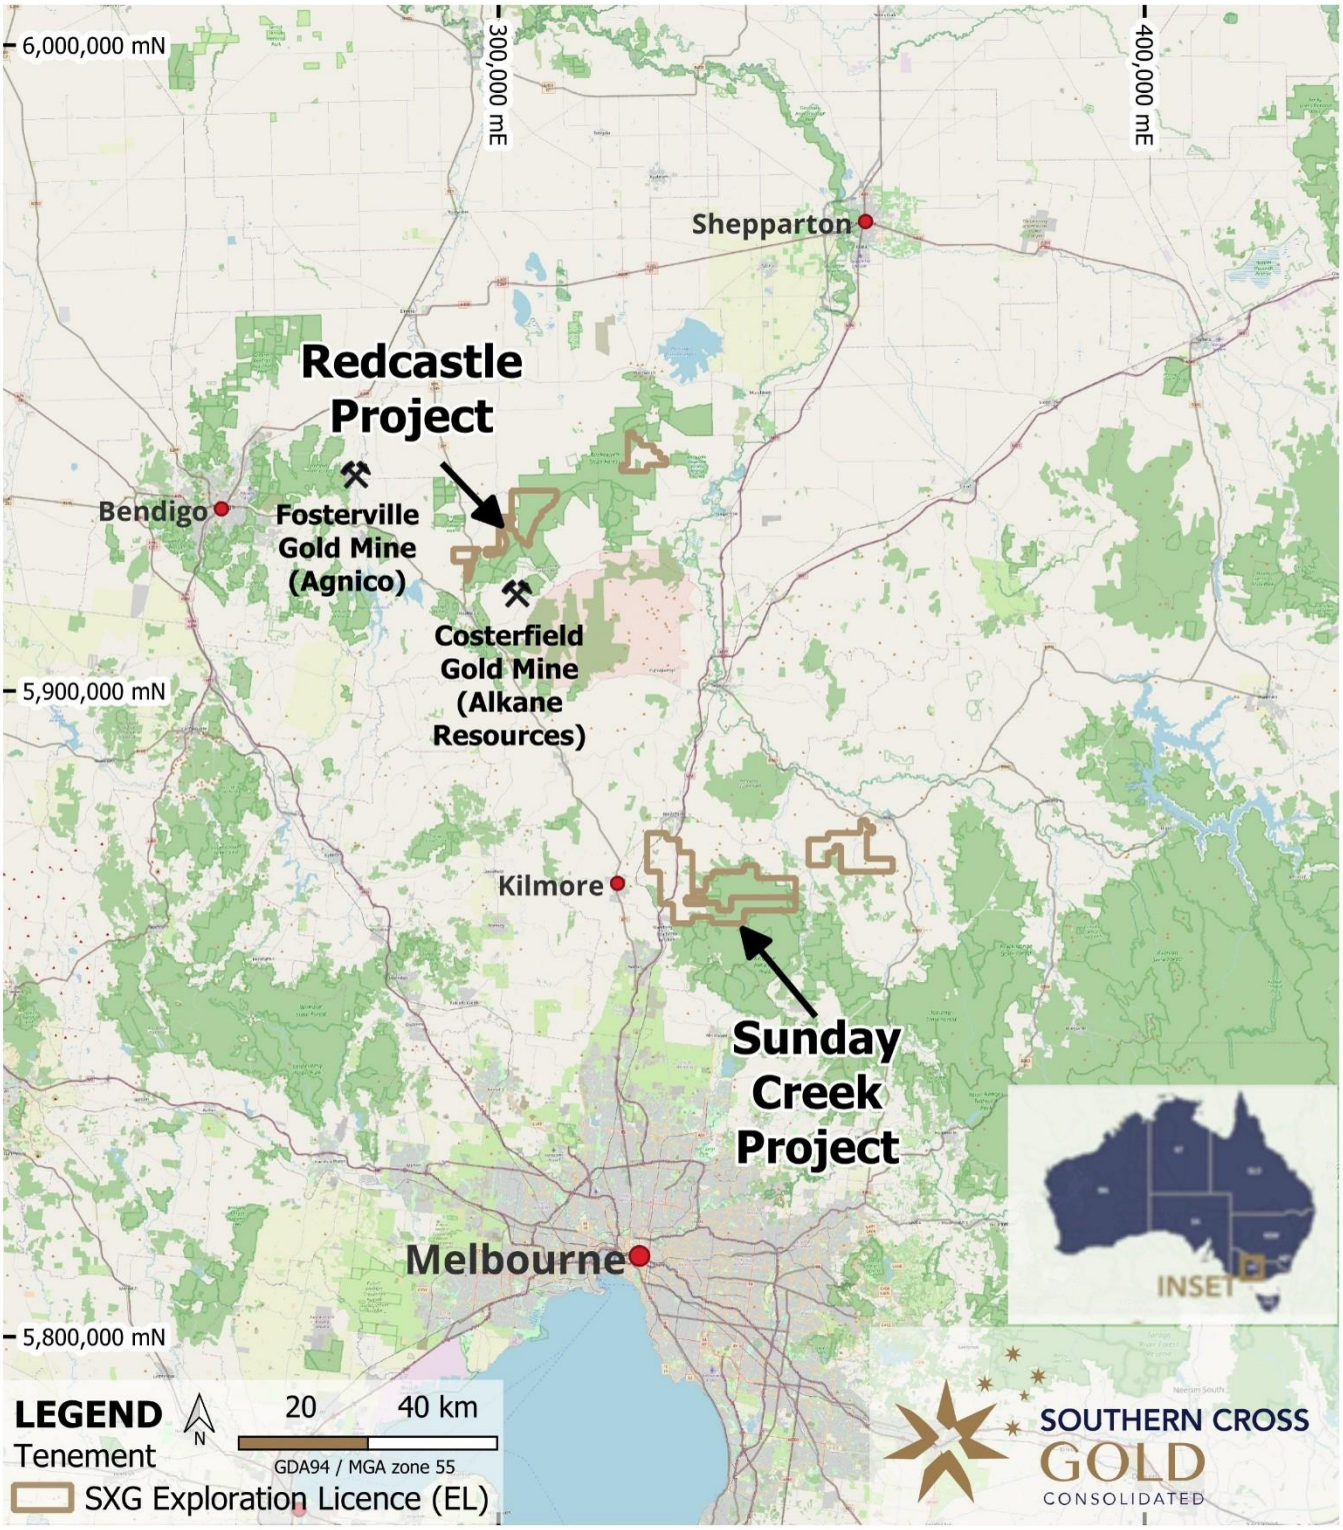

Table 1: Drill collar summary table for recent drill holes in progress.

JORC Table 1

Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralization that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralization types (e.g. submarine nodules) may warrant disclosure of detailed information.*	• Sampling has been conducted on drill core (half core for >90% and quarter core for check samples), grab samples (field samples of in-situ bedrock and boulders; including duplicate samples), trench samples (rock chips, including duplicates) and soil samples (including duplicate samples). Locations of field samples were obtained by using a GPS, generally to an accuracy of within 5 metres. Drill hole and trench locations have been confirmed to <1 metre using a differential GPS. Samples locations have also been verified by plotting locations on the high-resolution Lidar maps • Drill core is marked for cutting and cut using an automated diamond saw used by Company staff in Kilmore. Samples are bagged at the core saw and transported to the Bendigo On Site Laboratory for assay. At On Site samples are crushed using a jaw crusher combined with a rotary splitter and a 1 kg split is separated for pulverizing (LM5) and assay. • Standard fire assay techniques are used for gold assay on a 30 g charge by experienced staff (used to dealing with high sulfide and stibnite-rich charges). On Site gold method by fire assay code PE01S. • Screen fire assay is used to understand gold grain-size distribution where coarse gold is evident. • ICP-OES is used to analyse the aqua regia digested pulp for an additional 12 elements (method BM011) and over-range antimony is measured using flame AAS (method known as B050). • Soil samples were sieved in the field and an 80-mesh sample bagged and transported to ALS Global laboratories in Brisbane for super-low level gold analysis on a 50 g samples by method ST44 (using aqua regia and ICP-MS). • Grab and rock chip samples are generally submitted to On Site Laboratories for standard fire assay and 12 element ICP-OES as described above.
Drilling techniques	• *Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).*	• HQ or NQ diameter diamond drill core, oriented using Axis Champ orientation tool with the orientation line marked on the base of the drill core by the driller/offsider. A standard 3 metre core barrel has been found to be most effective in both the hard and soft rocks in the project.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.*	• Core recoveries were maximised using HQ or NQ diamond drill core with careful control over water pressure to maintain soft-rock integrity and prevent

Criteria	JORC Code explanation	Commentary
	• *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	loss of fines from soft drill core. Recoveries are determined on a metre-by-metre basis in the core shed using a tape measure against marked up drill core checking against driller's core blocks. • Plots of grade versus recovery and RQD (described below) show no trends relating to loss of drill core, or fines.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.* • *The total length and percentage of the relevant intersections logged.*	• Geotechnical logging of the drill core takes place on racks in the company core shed. Core orientations marked at the drill rig are checked for consistency, and base of core orientation lines are marked on core where two or more orientations match within 10 degrees. Core recoveries are measured for each metre RQD measurements (cumulative quantity of core sticks > 10 cm in a metre) are made on a metre-by-metre basis. • Each tray of drill core is photographed (wet and dry) after it is fully marked up for sampling and cutting. • The ½ core cutting line is placed approximately 10 degrees above the orientation line so the orientation line is retained in the core tray for future work. • Geological logging of drill core includes the following parameters: Rock types, lithology Alteration Structural information (orientations of veins, bedding, fractures using standard alpha-beta measurements from orientation line; or, in the case of un-oriented parts of the core, the alpha angles are measured) Veining (quartz, carbonate, stibnite) Key minerals (visible under hand lens, e.g. gold, stibnite) • 100% of drill core is logged for all components described above into the company MX logging database. • Logging is fully quantitative, although the description of lithology and alteration relies on visible observations by trained geologists. • Each tray of drill core is photographed (wet and dry) after it is fully marked up for sampling and cutting. • Logging is considered to be at an appropriate quantitative standard to use in future studies.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.*	• Drill core is typically half-core sampled using an Almonte core saw. The drill core orientation line is retained. • Quarter and half core is used when taking sampling duplicates (termed FDUP in the database). • Sampling representivity is maximised by always taking the same side of the drill core (whenever oriented),and consistently drawing a cut line on the core where orientation is not possible. The field technician draws these lines.

Criteria	JORC Code explanation	Commentary
	• *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• Sample sizes are maximised for coarse gold by using half core, and using quarter core and half core splits (laboratory duplicates) allows an estimation of nugget effect. • In mineralized rock the company uses approximately 10% of core duplicates, certified reference materials (suitable OREAS materials), laboratory sample duplicates and instrument repeats. • In the soil sampling program duplicates were obtained every 25th sample and the laboratory inserted low-level gold standards regularly into the sample flow.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.*	• The fire assay technique for gold used by On Site is a globally recognised method, and over-range follow-ups including gravimetric finish and screen fire assay are standard. Of significance at the On Site laboratory is the presence of fire assay personnel who are experienced in dealing with high sulfide charges (especially those with high stibnite contents) – this substantially reduces the risk of inaccurate reporting in complex sulfide-gold charges. • Where screen fire assay is used, this assay will be reported instead of the original fire assay. • The ICP-OES technique is a standard analytical technique for assessing elemental concentrations. The digest used (aqua regia) is excellent for the dissolution of sulfides (in this case generally stibnite, pyrite and trace arsenopyrite), but other silicate-hosted elements, in particular vanadium (V), may only be partially dissolved. These silicate-hosted elements are not important in the determination of the quantity of gold, antimony, arsenic or sulphur. • A portable XRF has been used in a qualitative manner on drill core to ensure appropriate core samples have been taken (no pXRF data are reported or included in the MX database). • Acceptable levels of accuracy and precision have been established using the following methods *¼ duplicates* – half core is split into quarters and given separate sample numbers (commonly in mineralized core) – low to medium gold grades indicate strong correlation, dropping as the gold grade increases over 100 g/t Au. *½ duplicates* – core is split into halves and given separate sample numbers (commonly in mineralized core) – low to medium gold grades indicate strong correlation, dropping as the gold grade increases over 100 g/t Au. *Washes* – washes are inserted post visible gold or >1% visible stibnite to ensure contamination is minimised during the preparation stage *Blanks* – blanks are inserted after visible gold and in strongly mineralized rocks to confirm that the crushing and pulping are not affected by gold smearing onto the crusher and LM5 swing mill surfaces. Results are excellent, generally below detection limit and a single sample at 0.03 g/t Au. *Certified Reference Materials* – OREAS CRMs have been used throughout the

Criteria	JORC Code explanation	Commentary
		project including blanks, low (<1 g/t Au), medium (up to 5 g/t Au) and high-grade gold samples (> 5 g/t Au). Results are automatically checked on data import into the MX database to fall within 2 standard deviations of the expected value. *Laboratory splits* – On Site conducts splits of both coarse crush and pulp duplicates as quality control and reports all data. In particular, high Au samples have the most repeats. *Laboratory CRMs* – On Site regularly inserts their own CRM materials into the process flow and reports all data *Laboratory precision* – duplicate measurements of solutions (both Au from fire assay and other elements from the aqua regia digests) are made regularly by the laboratory and reported. • *Accuracy and precision* have been determined carefully by using the sampling and measurement techniques described above during the sampling (accuracy) and laboratory (accuracy and precision) stages of the analysis. • *Soil sample* company duplicates and laboratory certified reference materials all fall within expected ranges.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• The Independent Geologist has visited Sunday Creek drill sites and inspected drill core held at the Kilmore core shed - 11 December 2024 S.Tambanis. • The CP & QP, Mr Kenneth Bush has visually inspected the drill core from holes in this release. The drill intersections match both the geological descriptions in the database and the expected assay data (for example, gold and stibnite visible in drill core is matched by high Au and Sb results in assays). • In addition, on receipt of results Company geologists assess the gold, antimony and arsenic results to verify that the intersections returned expected data. • The electronic data storage in the MX database is of a high standard. Primary logging data are entered directly by the geologists and field technicians and the assay data are electronically matched against sample number on return from the laboratory. • Certified reference materials, ¼ core field duplicates (FDUP), laboratory splits and duplicates and instrument repeats are all recorded in the database. • Exports of data include all primary data, from hole SDDSC077B onwards after discussion with SRK Consulting. Prior to this gold was averaged across primary, field and lab duplicates. • Adjustments to assay data are recorded by MX, and none are present (or required). • Twinned drill holes are not available at this stage of the project.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.*	• Differential GPS used to locate drill collars, trenches and some workings • Standard GPS for some field locations (grab and soils samples), verified against Lidar data.

Criteria	JORC Code explanation	Commentary
	• *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• Downhole surveys are collected by either electronic single-shot, REFLEX EZ-TRAC multi-shot or Imdex/Axis north-seeking gyro or a combination. During drilling, surveys are completed at a maximum of 30m intervals, with multi-shot surveys completed at hole completion or upon request by geologists at 3m intervals during drilling unless ground conditions are unsuitable. • The grid system used throughout is Geocentric datum of Australia 1994; Map Grid Zone 55 (GDA94_Z55), also referred to as ELSG 28355. Reported azimuths also relate to MGA55 (GDA94_Z55). • Topographic control is excellent owing to sub 10 cm accuracy from Lidar data.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• The data spacing is suitable for reporting of exploration results – evidence for this is based on the improving predictability of high-grade gold-antimony intersections. • At this time, the data spacing and distribution are not sufficient for the reporting of Mineral Resource Estimates. This however may change as knowledge of grade controls increase with future drill programs. • Samples have been composited to a 1 g/t AuEq over 2.0 m width for lower grades and 5 g/t AuEq over 1.0 m width for higher grades in table 3. All individual assays above 0.1 g/t AuEq have been reported to two decimal places with no compositing in table 4.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralized structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• The true thickness of the mineralized intervals reported are interpreted to be approximately 40-90% of the sampled thickness. • Drilling is oriented in an optimum direction when considering the combination of host rock orientation and apparent vein control on gold and antimony grade. The steep nature of some of the veins may give increases in apparent thickness of some intersections, but more drilling is required to quantify. • A sampling bias is not evident from the data collected to date (drill holes cut across mineralized structures at a moderate angle).
Sample security	• *The measures taken to ensure sample security.*	• Drill core is delivered to the Kilmore core logging shed by either the drill contractor or company field staff. Samples are marked up and cut by company staff at the Kilmore core shed, in an automated diamond saw and bagged before loaded onto strapped secured pallets and trucked by company staff to Bendigo for submission to the laboratory. There is no evidence in any stage of the process, or in the data for any sample security issues.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• Continuous monitoring of CRM results, blanks and duplicates is undertaken by geologists and the company data geologist. Mr Kenneth Bush for SXG has the orientation, logging and assay data.

Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• The Sunday Creek Project, previously known as the Clonbinane Project, is covered by the Retention Licence RL 6040 and is surrounded by Exploration Licence EL6163 and Exploration Licence EL7232. All the licences are 100% held by Clonbinane Goldfield Pty Ltd, a wholly owned subsidiary company of Southern Cross Gold Ltd.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• The Sunday Creek project is a high level orogenic (or epizonal) Fosterville-style deposit. Small scale mining has been undertaken in the project area since the 1880s continuing through to the early 1900s. Historical production occurred with multiple small shafts and alluvial workings across the Clonbinane Goldfield permits. Production of note occurred at the Clonbinane area with total production being reported as 41,000 oz gold at a grade of 33 g/t gold (Leggo and Holdsworth, 2013) • Work in and nearby to the Sunday Creek Project area by previous explorers typically focused on finding bulk, shallow deposits. Beadell Resources were the first to drill deeper targets and Southern Cross have continued their work in the Sunday Creek Project area. • EL54 - Eastern Prospectors Pty Ltd Rock chip sampling around Christina, Apollo and Golden Dyke mines. Rock chip sampling down the Christina mine shaft. Resistivity survey over the Golden Dyke. Five diamond drill holes around Christina, two of which have assays. • ELs 872 & 975 - CRA Exploration Pty Ltd Exploration focused on finding low grade, high tonnage deposits. The tenements were relinquished after the area was found to be prospective but not economic. Stream sediment samples around the Golden Dyke and Reedy Creek areas. Results were better around the Golden Dyke. 45 dump samples around Golden Dyke old workings showed good correlation between gold, arsenic and antimony. Soil samples over the Golden Dyke to define boundaries of dyke and mineralization. Two costeans parallel to the Golden Dyke targeting soil anomalies. Costeans since rehabilitated by SXG. • ELs 827 & 1520 - BHP Minerals Ltd Exploration targeting open cut gold mineralization peripheral to SXG tenements.

Criteria	JORC Code explanation	Commentary
		• ELs 1534, 1603 & 3129 - Ausminde Holdings Pty Ltd Targeting shallow, low grade gold. Trenching around the Golden Dyke prospect and results interpreted along with CRAs costeans. 29 RC/Aircore holes totalling 959 m sunk into the Apollo, Rising Sun and Golden Dyke target areas. • ELs 4460 & 4987 - Beadell Resources Ltd ELs 4460 and 4497 were granted to Beadell Resources in November 2007. Beadell successfully drilled 30 RC holes, including second diamond tail holes in the Golden Dyke/Apollo target areas. • Both tenements were 100% acquired by Auminco Goldfields Pty Ltd in late 2012 and combined into one tenement EL4987. • Nagambie Resources Ltd purchased Auminco Goldfields in July 2014. EL4987 expired late 2015, during which time Nagambie Resources applied for a retention licence (RL6040) covering three square kilometres over the Sunday Creek Project. RL6040 was granted July 2017. • Clonbinane Goldfield Pty Ltd was purchased by Mawson Gold Ltd in February 2020. Mawson drilled 30 holes for 6,928 m and made the first discoveries to depth.
Geology	• *Deposit type, geological setting and style of* • *mineralization.*	• Refer to the description in the main body of the release.

Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following*
	• *information for all Material drill holes:*
	  ○ *easting and northing of the drill hole collar*
	  ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar*
	  ○ *dip and azimuth of the hole*
	  ○ *down hole length and interception depth*
	  ○ *hole length.*
	• *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*
		• Refer to appendices

Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high-grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for*	• See “Further Information” and “Metal Equivalent Calculation” in main text of press release.

Criteria	JORC Code explanation	Commentary
	such aggregation should be stated and some typical examples of such aggregations should be shown in detail. • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	
Relationship between mineralization widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralization with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g 'down hole* • *length, true width not known').*	• See reporting of true widths in the body of the press release.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• The results of the diamond drilling are displayed in the figures in the announcement.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high-grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• All results above 0.1 g/t Au have been tabulated in this announcement. The results are considered representative with no intended bias. • Core loss, where material, is disclosed in tabulated drill intersections.

Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Preliminary testing was reported in January 11, 2024. This established the general metallurgical test procedure for samples from the Sunday Creek deposits and demonstrated the basis for confidence in establishing prospects for economic recovery of contained gold and antimony to three separate products:
		  ○ Metallic gold product by gravity recovery
		  ○ Antimony-gold flotation concentrate
		  ○ Pyrite-arsenopyrite-gold flotation concentrate
		• Testing has now been expanded to include samples from additional zones of the mineral deposits and to refine metallurgical processes. The aim was to improve aspects of antimony concentrate production, maximise gold recovery to a high-grade metallic product, and to further investigate the nature of gold occurrence.
		• The work, conducted by ALS Burnie Laboratories, focused on:
		  ○ Improving selectivity between sulphide minerals in the antimony flotation stage whilst maintaining high overall gold recovery.
		  ○ Further processing of the flotation concentrates, to assess the metallurgical response of contained gold.

Criteria	JORC Code explanation	Commentary
		○ Mineralogical examination of selected product samples. • It was demonstrated that, with appropriate process conditions, high antimony and gold recovery could be maintained whilst rejecting arsenic and iron sulphides in the first flotation stage. The antimony concentrate produced (~50% Sb, <0.2% As) is deemed to be attractive to the smelter market. • Recovery of antimony to concentrate varied with feed type, and ranged from 83% to 93% for the samples tested from the antimony rich zones. • Additional metallic gold was recovered from the flotation concentrate by gravity separation. • The gold grade of the concentrate is a function of the proportion of feed gold associated with arsenic-iron sulphides, the ratio of gold to antimony in the feed, the gold recovered to the metallic gold product, and the flotation rate of gold in the first flotation stage. • High overall gold recovery was achieved with all samples tested. • *Further Work* ○ Additional characterization testing across deposit zones ○ Locked cycle testing to confirm overall recoveries ○ Multi-stage cleaning optimization to maximize concentrate quality ○ Pilot plant evaluation of larger samples ○ Process plant design studies targeting Q1 2027 completion
Further work	• *The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• The Company has stated it will drill 200,000 m through 2025 to Q1 2027. • See diagrams in presentation which highlight current and future drill plans.
