

**24 August 2026**

## Second Hole Delivers Highest-Ever MREO Intercept at Morro do Ferro: 53m at 10% TREO and 1.7% MREO from Surface

**MFSR-052 intersects 137m at 4.31% TREO from surface, including 26.9m at 13.0% TREO with 2.40% magnet rare earth oxides of whole rock, and a Project-record MREO sample of 3.96% - extending known high-grade mineralisation**

### 137m @ 4.31% TREO

full-hole intercept from surface · 0.73% MREO

### 53m @ 9.87% TREO

from surface · 1.69% MREO of whole rock

### 26.9m @ 13.0% TREO

from 19m · 2.40% MREO - highest-grade zone

### Highlights

- **MFSR-052 intersects thick, high-grade rare earth mineralisation from surface - 137m at 4.31% TREO (0.73% MREO of whole rock), including:**
  - **53m at 9.87% TREO (98,700 ppm) with 1.69% MREO, from surface, and**
  - **26.9m at 13.0% TREO with 2.40% MREO from 19m** - the highest-grade wide intersection recorded at the Project, carrying elevated heavy rare earths
- **Project-record MREO:** peak sample of 19.51% TREO (195 kg/t) with 3.96% MREO over 2m from 39m - the highest MREO sample recorded at Morro do Ferro
- **Continuity confirmed:** MFSR-052 is collared 31.5m from MFSR-051 on the same section - MFSR-051 returned 116m at 4.78% TREO from surface, including 31m at 10.0% TREO and 1.58% MREO from 14m, with a peak of 18.12% TREO over 2m; the c.10% TREO core widens from 31m to 53m and mineralisation remains open
- **High-grade gallium:** 2m at 87.7 ppm Ga from 83m - the highest reliable gallium result at the Project
- **Momentum:** two rigs operating; ~25 holes for ~4,000m to extend high-grade mineralisation and provide metallurgical samples; further assays pending

### What These Results Mean

- **Exceptional magnet REE grades.** MREO of 1.69% over 53m and 2.40% over 26.9m are reported against whole rock - most deposits report MREO only as a percentage of TREO because absolute concentrations are far lower.
- **Thick, coherent, from surface.** Both holes mineralised from surface (137m and 116m), collared 31.5m apart on the same section, with the ~10% TREO core widening from 31m to 53m hole-on-hole, and mineralisation remains open.
- **The right basket.** Nd-Pr with elevated Dy-Tb and additional heavy rare earths (Gd, Er, Ho) through the high-grade zone, plus the Project's best reliable gallium result at depth.
- **Strategic relevance.** Results reinforce MDF's potential as an emerging premium magnet rare earth development project amid demand for diversified supply into energy, manufacturing and defence.

### Next Key Catalysts

#### Assay flow

MFSR-053 onwards - pending at laboratory; released as received

#### Drilling

~25 holes / ~4,000m · 2 rigs · extra shifts from 4 Aug

#### Met test work

dedicated sampling within the program

#### Gallium

analytical method resolution with the laboratory

## Results at a Glance

| Hole            | Interval (downhole)             | Width (m)  | TREO %       | MREO % whole rock |
|-----------------|---------------------------------|------------|--------------|-------------------|
| <b>MFSR-052</b> | <b>0 – 137m (from surface)</b>  | <b>137</b> | <b>4.31</b>  | <b>0.73</b>       |
|                 | incl. 0 – 105m                  | 105        | 5.45         | 0.93              |
|                 | incl. 0 – 53m                   | 53         | <b>9.87</b>  | <b>1.69</b>       |
|                 | incl. 19 – 45.9m                | 26.9       | <b>13.0</b>  | <b>2.40</b>       |
|                 | peak sample 39 – 41m (MFP-0178) | 2          | <b>19.51</b> | <b>3.96</b>       |
| <b>MFSR-051</b> | <b>0 – 116m (from surface)</b>  | <b>116</b> | <b>4.78</b>  | <b>0.78*</b>      |

|                 | peak sample (2m interval)       | 2          | <b>18.12</b> | <b>3.66</b>       |

Ranked significant intersections, MFSR-051 and MFSR-052. Downhole widths; weighted averages of all samples across the reported length with no cut-offs unless stated, and may not represent true thickness. \*MFSR-051 full-interval MREO as shown in Figure 1. MFSR-051 results per ASX announcement dated 31 July 2026.

**Power Minerals Limited (ASX: PNN | OTCQB: PEIMF) (Power or the Company)** is pleased to report assay results for MFSR-052, the second drillhole of its maiden diamond drilling program at the Morro do Ferro Rare Earth Project (MDF Project) in southern Minas Gerais state, Brazil.

MFSR-052 intersected thick, high-grade Total Rare Earth Oxide (TREO) and Magnet Rare Earth Oxide (MREO) mineralisation from the surface at 137m at 43,125 ppm (4.31%) TREO, containing 7,337 ppm (0.73% of whole rock) MREO, with all significant intersections ranked in the table above. The peak sample returned 19.51% TREO with 3.96% MREO (39,555 ppm) over 2m from 39m (sample MFP-0178), the highest MREO sample recorded at the Project.

Power Minerals Chief Executive Officer, Alistair Stephens, said:

*“The results from MFSR-052 mark another important step in establishing the scale, grade and strategic character of Morro do Ferro. The 137m mineralised interval, including 53m at 9.87% TREO and 1.69% MREO, together with the elevated heavy rare-earth content, provides strong continuity with our first drill hole.*

*Morro do Ferro is advancing at a time when governments and industry are seeking credible, geographically diversified sources of the magnet rare earths essential to modern energy systems, advanced manufacturing and defence technologies. Although our drilling programme remains in its early stages and further technical work is required, these results reinforce the project's potential to emerge as a rare-earth asset of international significance.*

*With two drill rigs now operating, Power Minerals is advancing the programme with urgency, discipline and a clear sense of purpose. Our objective is to define a project capable of making a meaningful contribution to Brazil's critical-minerals industry and to the security and resilience of global supply chains.”*

### High-Grade Heavy Rare Earth Zone: 26.9m at 13.0% TREO from 19m

Within the 53m surface intercept, the interval from 19m to 45.9m downhole returned the highest-grade wide intersection recorded at the Project to date: 26.9m at 130,427 ppm (13.0%) TREO, including 24,034 ppm (2.40% of whole rock) MREO. The interval also carries elevated heavy rare earth oxides. Constituent oxide grades over the 26.9m interval are set out below:

| Oxide                                                 | ppm           | % whole rock | Basket             |
|-------------------------------------------------------|---------------|--------------|--------------------|
| Neodymium oxide (Nd <sub>2</sub> O <sub>3</sub> )     | 16,634        | 1.66         | MREO               |
| Praseodymium oxide (Pr <sub>6</sub> O <sub>11</sub> ) | 6,702         | 0.67         | MREO               |
| Dysprosium oxide (Dy <sub>2</sub> O <sub>3</sub> )    | 579           | 0.06         | MREO               |
| Terbium oxide (Tb <sub>4</sub> O <sub>7</sub> )       | 120           | 0.01         | MREO               |
| <b>Total MREO</b>                                     | <b>24,034</b> | <b>2.40</b>  | <b>Nd+Pr+Tb+Dy</b> |
| Gadolinium oxide (Gd <sub>2</sub> O <sub>3</sub> )    | 933           | 0.09         | Other HREO         |
| Erbium oxide (Er <sub>2</sub> O <sub>3</sub> )        | 235           | 0.02         | Other HREO         |
| Holmium oxide (Ho <sub>2</sub> O <sub>3</sub> )       | 90            | 0.01         | Other HREO         |

*MREO = Nd<sub>2</sub>O<sub>3</sub> + Pr<sub>6</sub>O<sub>11</sub> + Tb<sub>4</sub>O<sub>7</sub> + Dy<sub>2</sub>O<sub>3</sub> (see definitions in the Competent Persons section). Gd, Er and Ho oxides sit outside the Company's MREO definition and are shown separately. Constituent oxides are independently rounded.*

The highest individual result in MFSR-052 was 19.51% TREO (195 kg/t) with 3.96% MREO over a two-metre interval from 39m (sample MFP-0178) - the highest MREO sample recorded at the Project. This closely follows the first angled drillhole, MFSR-051, which recorded 18.12% TREO over a similar two-metre interval (see ASX announcement dated 31 July 2026). The best individual historical result at Morro do Ferro remains 2m at 241,301 ppm (24.13%) TREO from sample 1156 in drillhole MFSR-44 (see ASX announcement dated 5 March 2026).

### High-Grade Gallium Intersected

As previously announced, gallium assays at Morro do Ferro are affected by analytical interference from the extremely high concentrations of rare earth elements. Despite this interference, the following individual result has been received:

- **2m at 87.7 ppm Ga from 83m in drillhole MFSR-052 (sample MFP-0206)**

This is the highest reliable gallium result recorded at Morro do Ferro and confirms the elevated gallium at depth reported from MFSR-051 (see ASX announcement dated 31 July 2026). Discussions are being held with the commercial laboratory on the best method to obtain accurate and reliable gallium analyses in the presence of high rare earth concentrations.

**Figure 1.** Cross-section looking northwest showing current Power Minerals drillholes. The whole-rock MREO percentage (which includes Nd, Pr, Tb & Dy oxides) is shown on the left and the TREO percentage on the right. MFSR-051 results were provided in the ASX announcement dated 31 July 2026.

## Program Update

The second drill rig arrived in late July and commenced full operations, with two additional shifts starting on 4 August 2026. The Company continues to verify field measurements and downhole data throughout the drilling process; these findings, along with laboratory geochemical assays, will be released as they become available.

The commercial laboratory has advised of delays in reporting assay results due to internal issues unrelated to Power. Further results will be released as they are received.

**Figure 2.** Location map showing current Power Minerals Morro do Ferro drillholes and intercepts from previous drillholes (see ASX announcements dated 8 April 2026).

## Next Steps

| Workstream                           | Scope                       | Status                        |
|--------------------------------------|-----------------------------|-------------------------------|
| Maiden diamond drilling program      | ~25 holes / ~4,000m HQ core | Ongoing - 2 rigs              |
| Assays - subsequent drillholes       | SGS Geosol, Brazil          | Pending; released as received |
| Metallurgical test work sampling     | Dedicated core intervals    | Planned within program        |
| Gallium analytical method review     | With commercial laboratory  | In progress                   |
| Field and downhole data verification | Continuous through drilling | Ongoing                       |

### **About Power Minerals Limited**

Power Minerals Limited is an ASX-listed exploration and development company. We are focused on transforming our lithium brine resources in Argentina, exploring and developing our promising REE, niobium and other critical mineral assets in Brazil, and maximising value from our Australian, Canadian, and other Argentine assets.

### **Competent Persons Statement**

The information in this announcement relating to exploration results in respect of the Morro do Ferro REE Project in Brazil is based on and fairly represents information and supporting documentation prepared by Steven Cooper, FAusIMM (No 108265), FGS (No.1030687). Mr Cooper is the Global Exploration Manager and is a full-time employee of the Company. Mr Cooper has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Cooper consents to the inclusion in the announcement of the matters based on his information in the form and context in which it appears.

This announcement contains references to exploration results that have been previously released on the ASX. Power Minerals confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements and that all material assumptions and technical parameters underpinning the estimates continue to apply and have not materially changed as per Listing Rule 5.23.2. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

The interval results mentioned in this announcement represent weighted averages by distance of all samples across the full reported length, applying no upper or lower cut-offs unless specified. Depths reported are downhole distances and may not represent true thickness. Full previous Morro do Ferro drillhole details are provided in Power Minerals ASX announcements dated 5 March, 8 April, 28 April, and 31 July 2026.

Given the exceptionally high concentrations of MREO in the Morro do Ferro deposit, the results are presented as a percentage (or ppm) of the whole rock. It is common practice to report MREO as a percentage of TREO rather than whole rock, owing to the typically low elemental concentrations found in most deposits.

Power Minerals uses the following definitions:

- TREO (Total Rare Earth Oxides) =  $[La_2O_3] + [CeO_2] + [Pr_6O_{11}] + [Nd_2O_3] + [Sm_2O_3] + [Eu_2O_3] + [Gd_2O_3] + [Tb_4O_7] + [Dy_2O_3] + [Ho_2O_3] + [Er_2O_3] + [Tm_2O_3] + [Yb_2O_3] + [Lu_2O_3] + [Y_2O_3]$
- MREO (Magnet Rare Earth Oxides) =  $[Nd_2O_3] + [Pr_6O_{11}] + [Tb_4O_7] + [Dy_2O_3]$

### Forward-Looking Statements

This announcement contains forward-looking statements based on current expectations and assumptions, which are subject to risks and uncertainties that may cause actual results to differ materially. These include project acquisition and divestment, joint venture, commodity price, exploration, development, operational, regulatory, environmental, title, funding and general economic risks. The Company undertakes no obligation to update these statements except as required by law.

## JORC Code, 2012 Edition – Table 1 report template

### Section 1. Sampling Techniques and Data

Criteria in this section apply to all succeeding sections.)

| Criteria                   | JORC Code explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Sampling techniques</b> | <ul style="list-style-type: none"> <li><i>Nature and quality of sampling (eg. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as downhole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i></li> <li><i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></li> <li><i>Aspects of the determination of mineralisation that are Material to the Public Report.</i></li> <li><i>In cases where 'industry standard' work has been done this would be relatively simple (eg. 'reverse circulation drilling was used to obtain 1m samples from which 3kg was pulverised to produce a 30g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg. submarine nodules) may warrant disclosure of detailed information.</i></li> </ul> | <ul style="list-style-type: none"> <li>The exploration results for rare earth oxides (REO) and Ga shared in this ASX announcement from the Brazilian Morro do Ferro Project have been prepared using drillhole samples and results collected by Power Minerals Limited (PNN) during June-August 2026.</li> <li>The HQ diamond core drilling program commenced on 15 June 2026 by Power Minerals Ltd. The second drillhole (MFSR-052) reached a total downhole depth of 173.3m. A total of 87 half-core samples (excluding QC samples) from this drillhole were analysed by the SGS Geosol laboratory, Brazil. This drillhole was angled at -60°.</li> <li>In July 2026, following logging, measuring and cutting the core, Power Minerals dispatched the half-core samples for geochemical analyses by the commercial laboratory SGS Geosol using standard methods ICP95A and IMS95A. The analysis involved crushing, pulverisation to 95% &lt;150#, lithium metaborate fusion, followed by ICP-OES/MS to determine the whole-rock concentration of 48 major oxides and trace elements (including LOI by PHY01E). For over-limit REE analyses, SGS Geosol used the method IMS95RS (metaborate fusion followed by ICP-MS finish).</li> </ul> |

| <b>Quality of assay data and laboratory tests</b>                                | <ul style="list-style-type: none"><li>• The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li><li>• For geophysical tools, handheld XRF instruments, etc, the used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li><li>• Nature of quality control procedures adopted (eg. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (lack of bias) and precision have been established.</li></ul> | <ul style="list-style-type: none"><li>• Geochemical analysis for Morro do Ferro's third drillhole by Power Minerals was completed by SGS Geosol Laboratory, Vespasiano, Minas Gerais (MG), Brazil. This commercial laboratory is independent and is certified to ISO 9001:2015 and ISO 14001:2015. The samples from drillhole MFSR-052 were blindly submitted in two separate batches (PO2601274 and PO2601279).</li><li>• The geochemical results for the drillholes were analysed using methods ICP95A and IMS95A. These analyses involved crushing and pulverisation to 95% &lt;150#, then lithium metaborate fusion followed by ICP-OES/MS to determine the whole rock concentration of 48 major oxides and trace elements (including LOI by PHY01E). Samples with concentrations of REE and Th above the method detection limit were re-analysed using the SGS Geosol method IMS95RS. If niobium by method IMS95A is above the upper limit of 0.1% Nb, then the method ICP95A is used for Nb. Due to the doubly charged interferences between gallium and elevated LREE, SGS Geosol does not report Ga analyses by ICP-MS if Ce is over 1000ppm.</li><li>• The lithium borate fusion method ensures a complete breakdown of samples, even those containing the most resilient acid-resistant minerals. This technique is deemed suitable for analysing REE from the Morro do Ferro Project.</li></ul> <p>The table below lists the general elements measured by the SGS methods along with their corresponding detection limits:</p> <p>(17.1) ICP95A</p> <table><tr><th colspan="8">Determination by Fusion with Lithium Metaborate - ICP OES</th></tr><tr><td>Al<sub>2</sub>O<sub>3</sub></td><td>0.01 - 75 (%)</td><td>Ba</td><td>10 - 100000 (ppm)</td><td>CaO</td><td>0.01 - 60 (%)</td><td>Cr<sub>2</sub>O<sub>3</sub></td><td>0.01 - 10 (%)</td></tr><tr><td>Fe<sub>2</sub>O<sub>3</sub></td><td>0.01 - 75 (%)</td><td>K<sub>2</sub>O</td><td>0.01 - 25 (%)</td><td>MgO</td><td>0.01 - 30 (%)</td><td>MnO</td><td>0.01 - 10 (%)</td></tr><tr><td>Na<sub>2</sub>O</td><td>0.01 - 30 (%)</td><td>P<sub>2</sub>O<sub>5</sub></td><td>0.01 - 25 (%)</td><td>SiO<sub>2</sub></td><td>0.01 - 90 (%)</td><td>Sr</td><td>10 - 100000 (ppm)</td></tr><tr><td>TiO<sub>2</sub></td><td>0.01 - 25 (%)</td><td>V</td><td>5 - 10000 (ppm)</td><td>Zn</td><td>5 - 10000 (ppm)</td><td>Zr</td><td>11 - 100000 (ppm)</td></tr></table> <p>(17.2) IMS95A</p> <table><tr><th colspan="8">Determination by Fusion with Lithium Metaborate - ICP MS</th></tr><tr><td>Ce</td><td>0.1 - 10000 (ppm)</td><td>Co</td><td>0.5 - 10000 (ppm)</td><td>Cs</td><td>0.05 - 1000 (ppm)</td><td>Cu</td><td>5 - 10000 (ppm)</td></tr><tr><td>Dy</td><td>0.05 - 1000 (ppm)</td><td>Er</td><td>0.05 - 1000 (ppm)</td><td>Eu</td><td>0.05 - 1000 (ppm)</td><td>Ga</td><td>0.1 - 10000 (ppm)</td></tr><tr><td>Gd</td><td>0.05 - 1000 (ppm)</td><td>Hf</td><td>0.05 - 500 (ppm)</td><td>Ho</td><td>0.05 - 1000 (ppm)</td><td>La</td><td>0.1 - 10000 (ppm)</td></tr><tr><td>Lu</td><td>0.05 - 1000 (ppm)</td><td>Mo</td><td>2 - 10000 (ppm)</td><td>Nb</td><td>0.05 - 1000 (ppm)</td><td>Nd</td><td>0.1 - 10000 (ppm)</td></tr><tr><td>Ni</td><td>5 - 10000 (ppm)</td><td>Pr</td><td>0.5 - 10000 (ppm)</td><td>Rb</td><td>0.2 - 10000 (ppm)</td><td>Sm</td><td>0.1 - 10000 (ppm)</td></tr><tr><td>Sn</td><td>0.3 - 1000 (ppm)</td><td>Ta</td><td>0.5 - 10000 (ppm)</td><td>Tb</td><td>0.05 - 1000 (ppm)</td><td>Th</td><td>0.1 - 10000 (ppm)</td></tr><tr><td>Ti</td><td>0.05 - 1000 (ppm)</td><td>Tm</td><td>0.5 - 10000 (ppm)</td><td>U</td><td>0.05 - 1000 (ppm)</td><td>W</td><td>0.1 - 10000 (ppm)</td></tr><tr><td>Y</td><td>0.05 - 10000 (ppm)</td><td>Yb</td><td>0.1 - 1000 (ppm)</td><td></td><td></td><td></td><td></td></tr></table> <p>(17.3) PHY01E</p> <table><tr><th colspan="2">LOI (Loss on ignition) - Loss on ignition by calcination of the sample at 1000°C</th></tr><tr><td>LOI</td><td>-45 - 100 (%)</td></tr></table> <ul style="list-style-type: none"><li>• Determination of Loss on Ignition (LOI) by Gravimetric Method -1000°C</li><li>• Loss on ignition (LOI) by calcination at 1000°C</li></ul> | Determination by Fusion with Lithium Metaborate - ICP OES |                  |                   |                                |                   |  |  |  | Al <sub>2</sub> O <sub>3</sub> | 0.01 - 75 (%) | Ba | 10 - 100000 (ppm) | CaO | 0.01 - 60 (%) | Cr <sub>2</sub> O <sub>3</sub> | 0.01 - 10 (%) | Fe <sub>2</sub> O <sub>3</sub> | 0.01 - 75 (%) | K <sub>2</sub> O | 0.01 - 25 (%) | MgO | 0.01 - 30 (%) | MnO | 0.01 - 10 (%) | Na <sub>2</sub> O | 0.01 - 30 (%) | P <sub>2</sub> O <sub>5</sub> | 0.01 - 25 (%) | SiO <sub>2</sub> | 0.01 - 90 (%) | Sr | 10 - 100000 (ppm) | TiO <sub>2</sub> | 0.01 - 25 (%) | V | 5 - 10000 (ppm) | Zn | 5 - 10000 (ppm) | Zr | 11 - 100000 (ppm) | Determination by Fusion with Lithium Metaborate - ICP MS |  |  |  |  |  |  |  | Ce | 0.1 - 10000 (ppm) | Co | 0.5 - 10000 (ppm) | Cs | 0.05 - 1000 (ppm) | Cu | 5 - 10000 (ppm) | Dy | 0.05 - 1000 (ppm) | Er | 0.05 - 1000 (ppm) | Eu | 0.05 - 1000 (ppm) | Ga | 0.1 - 10000 (ppm) | Gd | 0.05 - 1000 (ppm) | Hf | 0.05 - 500 (ppm) | Ho | 0.05 - 1000 (ppm) | La | 0.1 - 10000 (ppm) | Lu | 0.05 - 1000 (ppm) | Mo | 2 - 10000 (ppm) | Nb | 0.05 - 1000 (ppm) | Nd | 0.1 - 10000 (ppm) | Ni | 5 - 10000 (ppm) | Pr | 0.5 - 10000 (ppm) | Rb | 0.2 - 10000 (ppm) | Sm | 0.1 - 10000 (ppm) | Sn | 0.3 - 1000 (ppm) | Ta | 0.5 - 10000 (ppm) | Tb | 0.05 - 1000 (ppm) | Th | 0.1 - 10000 (ppm) | Ti | 0.05 - 1000 (ppm) | Tm | 0.5 - 10000 (ppm) | U | 0.05 - 1000 (ppm) | W | 0.1 - 10000 (ppm) | Y | 0.05 - 10000 (ppm) | Yb | 0.1 - 1000 (ppm) |  |  |  |  | LOI (Loss on ignition) - Loss on ignition by calcination of the sample at 1000°C |  | LOI | -45 - 100 (%) |

| <b>Data spacing and distribution</b>                           | <ul style="list-style-type: none"> <li>• <i>Data spacing for reporting of Exploration Results.</i></li> <li>• <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i></li> <li>• <i>Whether sample compositing has been applied.</i></li> </ul>                        | <ul style="list-style-type: none"> <li>• The previous auger drillholes were spaced approximately 40 metres apart and were located on five sections that were spaced approximately 100 to 120 metres apart over the crest of the hill, where the presence of REE mineralisation was already known from historical work. One section further to the northeast, and five additional sections to the southeast, were completed at a wider spacing along the trend of the mineralisation.</li> <li>• The 2012 cored drillholes were located along the five main sections (100 to 120 metres apart) used by the auger holes. Drillhole spacing along the lines varied from 40 to 100 metres.</li> <li>• The 2014 drilling program holes were located to provide more detailed information on the grade distribution of the high-grade core highlighted from the 2012 drilling. The 2014 infill drilling program utilised a spacing of 25 to 50 metres, with section lines positioned at intervals of 50 to 60 metres along the strike of the high-grade core. The quality, spacing, and distribution of the data are adequate for determining grade continuity in specific localised areas of the project. However, substantial sections along strike contain insufficient data, necessitating further drilling to enable accurate grade estimation in these areas. The current 2026 drilling by Power Minerals is designed to define the mineralisation better by increasing the drill density and depth penetrated.</li> </ul> |
| <b>Orientation of data in relation to geological structure</b> | <ul style="list-style-type: none"> <li>• <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i></li> <li>• <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i></li> </ul> | <ul style="list-style-type: none"> <li>• No orientation bias has been detected at this stage. It is expected that there will be a vertical variation related to the deep and near-total pervasive lateritic weathering.</li> <li>• The location of the project site is probably structurally controlled, but the internal target mineralogy may not be.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

The owner has both surface land rights and mineral mining rights, and there is no expiry date, provided that appropriate taxes are paid.</p> <ul style="list-style-type: none"> <li>Power Minerals Ltd has entered into a binding agreement to acquire the Morro do Ferro Project, contingent upon the successful completion of due diligence and certain exploration milestones. The company is not aware of any impediments that would hinder the transfer process.</li> <li>The permit covers a total area of 300.72 hectares and is currently in good standing with the appropriate government authorities. Furthermore, there are no identified obstacles to operating within the designated project area. The site is approximately 13km southeast of the city of Poços de Caldas, in the southern part of the Brazilian state of Minas Gerais. It is approximately 200km north of the large Brazilian city of São Paulo.</li> </ul>  |
| <b>Exploration done by other parties</b> | <ul style="list-style-type: none"> <li><i>Acknowledgment and appraisal of exploration by other parties.</i></li> </ul>                                                                            | <ul style="list-style-type: none"> <li>The Project was discovered after investigating a significant radiometric anomaly found during regional aerial geophysical surveys. The first systematic exploration was in 1956 for uranium, with the completion of 77 'Empire' shallow drillholes from 10 to 18 metres depth together with 18 diamond core drillholes totalling 1165m (deepest was 125m). A 210m adit along strike was dug and channel sampled, together with five cross-cutting trenches sampled at 1m intervals. Due to the lower uranium values than expected, the program was abandoned.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                |

The complex is circular-shaped, with a mean diameter of 33km and an area of approximately 800km². The plateau is a ring structure of Mesozoic age comprising a suite of alkaline volcanic and plutonic rocks, mainly phonolites and nepheline syenites.</li><li>The local geology of the Morro do Ferro Project is characterised by hydrothermally altered country rocks termed 'potassic rocks' overlain by a very deep weathering cover. The residual clay minerals are cross-cut by discrete veins and stockworks consisting of massive magnetite only, goethite only, or a combination of the two. The REE mineralisation is related to the cryptocrystalline minerals bastnasite and cerianite, which are expected to be the main REE-bearing minerals. There is reported minor monazite.</li></ul> |           |            |             |       |            |             |    |          |       |     |     |        |         |       |          |       |     |     |        |         |       |

| <b>Other substantive exploration data</b> | <ul style="list-style-type: none"> <li>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater,</li> </ul> | <ul style="list-style-type: none"> <li>A ground-based low-resolution magnetic survey was carried out during 2012 by contractor Pegasus Proseccao Mineral Ltda. The survey used five-metre reading intervals along north-south grid lines using a GEMS GSM19 system. The survey was diurnally corrected.</li> <li>A gamma spectrometry survey was completed alongside the magnetic survey. An Exploranium GR320 instrument was used.</li> </ul> |
