

Exceptional High-Grade Gold from Surface at Mt Olympus: 20m @ 19g/t Au and 43m @ 3.8g/t Au

Highlights

- Further high-grade intersections returned from the completed Mt Olympus Resource Definition Drilling Program, including:
 - **20m @ 19g/t Au** from 2m in KARC0206
 - **69m @ 3.0g/t Au** from 149m in KARC0207, including **26m @ 5.2g/t Au** from 149m and **7m @ 10g/t Au** from 150m
 - **43m @ 3.8g/t Au** from surface in KARC0194, including **30m @ 4.8g/t Au** and **8m @ 7.0g/t Au**
 - **30m @ 5.7g/t Au** from 193m in KADD0021
 - **44m @ 3.5g/t Au** from 15m in KARC0204
- The exceptional result in **KARC0206** demonstrates that high-grade feeder structures extend into the upper stratigraphic units, further advancing Kalamazoo's understanding of the Mt Olympus mineralised system
- Results provide further evidence of the vertical and strike continuity of high-grade feeder structures and increase confidence in the interpretation of grade distribution across the deposit
- Drilling has intersected mineralisation both within and beyond the current Mineral Resource model, including outside the resource envelope but within the conceptual Scoping Study pit shell
- Broad, high-grade mineralisation continues to be intersected from surface and at depth, both within and beyond the current Mineral Resource model
- The 72-hole, 13,726m Resource Definition Drilling Program is complete, with assays now received from 62 holes and further results pending
- The results will inform the updated Mt Olympus Mineral Resource Estimate targeted for Q4 2026 and the Ashburton Pre-Feasibility Study targeted for Q1 2027
- Underground Growth drilling is underway beneath Mt Olympus, together with further drilling at the high-grade gold Peake deposit

Kalamazoo's Executive Director Dr Ben Ackerman said today, *"These latest results represent another important step forward in our understanding of the Mt Olympus gold system. They provide further evidence of the scale, continuity and internal grade distribution of the mineralisation and increase our confidence in the geological interpretation underpinning the Mineral Resource update.*

*The standout intersection of **20 metres at 19 grams/tonne** gold from just two metres beneath the surface in KARC0206 is particularly encouraging. It demonstrates that the high-grade feeder structures are not confined to the lower siltstone unit but can extend upward into the upper stratigraphic units while maintaining exceptional grades.*

We are now recognising increasing vertical and strike continuity in these high-grade structures across the deposit. Together with the broad mineralised intersections returned from KARC0207, KARC0194 and other holes, this is helping us develop a more complete understanding of the structural controls on mineralisation and the distribution of high-grade zones at Mt Olympus.

As the geological model continues to mature, we are gaining greater confidence in both the continuity of the resource and the opportunities for further growth."

Kalamazoo's Chief Executive Officer Andrew McDougall added: *"The combination of exceptional near-surface grades, broad mineralised intervals and increasing geological confidence further strengthens Mt Olympus as the foundation asset for potentially long-life Ashburton gold operations. These results will be incorporated into the updated Mineral Resource Estimate and ongoing Pre-Feasibility Study, where the improved understanding of the high-grade structures has the potential to support resource growth and an enhanced future mining inventory."*

Kalamazoo Resources Limited ("Kalamazoo" or "the Company") (ASX: KZR) is pleased to report the successful completion of the Mt Olympus Resource Definition Drilling Program together with further outstanding assay results at its 100% owned Ashburton Gold Project ("AGP" or "Ashburton") in Western Australia.

Notably, drilling has also intersected mineralisation beyond the current resource envelope while remaining within the conceptual Scoping Study pit shell¹, highlighting opportunities to enhance future mining inventory.

The Resource Definition Drilling Program has significantly increased drilling density over the Mt Olympus open pit resource, reducing spacing to approximately 20m x 20m across key areas of the deposit. The closer-spaced drilling is increasing geological knowledge and understanding of the controls on mineralisation, while improving confidence in the geological model and the interpreted continuity of mineralised zones. The program supports mineral resource estimation work underway and the targeted release of an updated Mineral Resource Estimate ("MRE") in Q4 2026 which remains on track.

The cumulative results from the current Mt Olympus Resource Definition Drilling Program continue to demonstrate the strength and consistency of the mineralised system. Across the results received to date from the first 62 drillholes reported over four successive ASX releases, the program has returned 33 significant gold intercepts exceeding 50 gram-metres, highlighting the continuity of broad, high-grade

mineralisation, and providing increasing confidence in the Mineral Resource. The +50 gram-metre intercepts now received (in numerical but not highest gram-metres order) include^{2,3,4,10}:

- **30m @ 5.7g/t Au** from 193m in KADD0021
- **21m @ 6.5g/t Au** from 12m, incl. **10m @ 13g/t Au** from 14m and **50m @ 2.6g/t Au** from 129m incl. **24m @ 4.7g/t Au** from 143m in KARCD0141
- **45m @ 2.0g/t Au** from 93m, incl. **24m @ 3.0g/t Au** from 111m and **16.0m @ 5.5g/t Au** from 177m, incl. **11m @ 7.6g/t Au** from 178m in KARCD0142
- **25m @ 4.9g/t Au** from 106m, incl. **9m @ 11g/t Au** from 115m and **74m @ 4.1g/t Au** from 144m, incl. **17m @ 8.3g/t Au** from 144m; and incl. **36m @ 3.1g/t Au** from 165m in KARC0145
- **64m @ 1.9g/t Au** from 105m, incl. **29m @ 3.1g/t Au** from 129m, and **36m @ 16g/t Au** from 181m, incl. **10m @ 49g/t Au** from 202m in KARCD0146
- **47m @ 2.0g/t Au** from 79m and **7m @ 8.3g/t Au** from 195m in KARC0147
- **30m @ 3.6g/t Au** from 51m, incl. **27m @ 3.9g/t Au** from 53m and **17.6m @ 5.0g/t Au** from 165.8m incl **7.5m @ 7.4g/t Au** from 168.1m in KARCD0148
- **33m @ 2.3g/t Au** from 112m in KARCD0149
- **32m @ 2.8g/t Au** from 46m, incl. **14m @ 4.3g/t Au** from 49m in KARCD0153
- **60m @ 1.3g/t Au** from 51m in KARCD0165
- **14m @ 5.4g/t Au** from 150m in KARCD0167
- **9m @ 6.0g/t Au** from 22m and **22m @ 3.6g/t Au** from 61m in KARC0172
- **29m @ 3.8g/t Au** from 156m, incl. **18m @ 4.9g/t Au** from 167m in KARCD0157
- **29m @ 5.5g/t Au** from 128m, incl. **19m @ 5.6g/t Au** from 138m in KARCD0171
- **20m @ 3.2g/t Au** from 62m, incl. **11m @ 5.1g/t Au** from 64m in KARC0170
- **31m @ 5.2g/t Au** from 49m, incl. **15m @ 7.5g/t Au** from 53m in KARC0176
- **45m @ 2.0g/t Au** from 0m in KARC0180
- **30m @ 1.7g/t Au** from 4m KARC0182
- **32m @ 3.3g/t Au** from 0m, incl. **6m @ 11g/t Au** from 6m in KARC0188A
- **43m @ 3.8g/t Au** from 0m, incl **30m @ 4.8g/t Au** and incl **8m @ 7.0g/t Au** in KARC0194
- **26m @ 2.0g/t Au** from 10m and **14m @ 3.6g/t Au** from 117m in KARC0198
- **21m @ 3.8g/t Au** from 72m, incl. **12m @ 6.2g/t Au** from 78m in KARC0201A
- **44m @ 3.5g/t Au** from 15m, incl. **25m @ 3.6g/t Au** from 16m in KARC0204
- **30m @ 2.1g/t Au** from 65m, incl. **21m @ 2.7g/t Au** from 65m and **21m @ 2.7g/t Au** from 122m

and **30m @ 4.3g/t Au** from 152m incl. **13m @ 7.1g/t Au** from 156m in KARC0205

- **20m @ 19.0g/t Au** from 2m in KARC0206
- **69m @ 3g/t Au** from 149m, **incl 26m @ 5.2g/t Au** from 149m and **incl 7.0m @ 10g/t Au** from 150m in KARC0207

The remaining assay results are expected to be released progressively as they become available over the coming weeks.

Drilling programs are ongoing including the Underground Growth Drilling Program at Mt Olympus, targeting extensions beneath and down-plunge of the current Scoping Study pit, and drilling at Peake to test further growth potential of the existing Mineral Resource within the defined Exploration Target.

Ashburton Gold Project

The AGP is located 35km south-east of the Paraburdoo townsite and within the prospective Nanjilgardy Fault Zone, following the southern margin of the Pilbara Craton (Figure 1). Ashburton consists of four Mining Leases M52/639, M52/640, M52/734 and M52/735 that historically produced 350,000oz Au between 1998-2004 and seven Exploration Licences 52/1941, 52/3024, 52/3025, 52/4052, 52/4379, E52/3692 and E52/3711 and seven Prospecting Licences (P52/1592-98) for a total of 327km^{2,5}.

Recent tenement applications (E52/4508, E52/4509, E52/4594, E52/4610, E52/4611 and E52/4612) are expected to add 192km² to the project bringing **100% Kalamazoo controlled tenure across the highly prospective Ashburton region to 519km²** (Figure 1)⁶.

Figure 1: Ashburton Gold Project (blue polygons) geology map showing the location of historical mines, prospects, and gold resource estimates⁷ and extents of recent tenement applications, which would encompass an expanded footprint of 519km² of 100% KZR controlled tenure across the highly prospective Ashburton Region.

Mt Olympus Resource Definition Drilling Program

The Resource Definition Drilling Program finished at Mt Olympus in June 2026. The program was aimed at increasing geological confidence within the existing Mineral Resource, supporting the conversion of Inferred Resources to the Indicated category. This will also provide the basis for future Ore Reserve estimation and deliver key technical inputs for the ongoing PFS.

Results have now been returned from 62 of 72 drillholes from the program. The results continue to return intersections consistent with expectations and serve as confirmation of mineralisation continuity within the main conglomerate host sequence and key resource conversion areas, supporting the Company's geological targeting model for continued resource growth at Mt Olympus. The additional gold intersections exceeding 50 gram-metres, that have not previously been reported, are as follows:

- **30m @ 5.7g/t Au** from 193m in KADD0021
- **16m @ 5.5g/t Au** from 177m, incl. **11m @ 7.6g/t Au** from 178m in KARCD0142
- **30m @ 1.7g/t Au** from 4m in KARC0182
- **43m @ 3.8g/t Au** from 0m, incl 30m @ 4.8g/t Au and incl 8m @ 7.0g/t Au in **KARC0194**
- **26m @ 2.0g/t Au** from 10m and **14m @ 3.6g/t Au** from 117m in KARC0198
- **44m @ 3.5g/t Au** from 15m, incl. 25m @ 3.6g/t Au from 16m in KARC0204
- **20m @ 19g/t Au** from 2m in KARC0206
- **69m @ 3g/t Au** from 149m, incl 26m @ 5.2g/t Au from 149m and incl 7.0m @ 10g/t Au from 150m in KARC0207

A complete table of assay results from the 62 drillholes for which results have been received to date is included in the Appendices of this release. Significant assay intercepts for previously unreported assays in this ASX release are shown spatially in Figures 2, 3, 4, 5 and 6. Figures presented in this announcement are designed to highlight the most significant intersections from the Resource Definition Drilling Program.

To maintain readability, only intercepts exceeding 50 gram-metres are labelled, while lower grade intersections remain displayed and are reported in full within the accompanying drill results tables. All assay results have been considered in the geological interpretation and assessment of resource continuity.

The Resource Definition Drilling Program, which is now complete, has provided a higher density of drilling within the open pit resource volume as well as potential for resource extensions below and down plunge of the Mt Olympus **AUD\$4,000** pit shell defined in the Company's Scoping Study. The overall extent and coverage of the Resource Definition Drilling Program are shown in plan view and long section in Figure 2 and Figure 3, respectively. These figures illustrate the full drilling program including holes for which assay results remain pending.

Figure 2: Mt Olympus plan view showing drill traces and significant assay intercepts from recent Resource Definition Drilling Program, overlain on the 400mRL depth slice of the geological model. Current Mineral Resource outlines (red and green) and the Scoping Study AUD\$4,000/oz pit shell design (brown outline) are shown. For clarity, only new intercepts exceeding 50 gram-metres (Au grade × downhole length) are individually labelled; complete significant assay results are reported in the accompanying summary tables. New resource infill program drill hole traces are shown in blue and are awaiting return of assays.

Figure 3: Mt Olympus long section showing drill traces and significant assay intercepts from recent Resource Definition Drilling. Current Mineral Resource outlines (red and green) and the Scoping Study AUD\$4,000/oz pit shell design (brown outline) are shown. For clarity, only intercepts exceeding 50 gram-metres (Au grade × downhole length) are labelled; complete significant assay results are provided in the accompanying summary tables^{8,9}.

The potential quantity and grade of the Mt Olympus Exploration Target is conceptual in nature and, as such, there has been insufficient exploration drilling conducted to estimate a Mineral Resource. As this estimate is unconstrained, it is highly sensitive to new data. At this stage it is uncertain if further exploration drilling will result in the estimation of a Mineral Resource. The Exploration Target has been prepared in accordance with the JORC Code (2012).

While all sedimentary lithologies within the Mt Olympus mine sequence are mineralised, the interbedded conglomerate and sandstone unit represents the largest component of the current Mineral Resource. Results from the Resource Definition Drilling Program, including intersections in KARC0194, KARC0182 and KARC0207 (Figures 4 and 5), continue to demonstrate excellent continuity relative to the existing Mineral Resource block model.

KARC0194 returned **43m @ 3.8g/t Au**, representing an improvement in grade relative to the existing block model. **KARC0207** returned **69m @ 3.0g/t Au**, demonstrating the continuity of strong mineralisation within the interbedded conglomerate and sandstone units in the upper host stratigraphy of the Mt Olympus deposit.

Figure 4: Mt Olympus cross section 592220mE looking west and centred on drill hole KARC0207 section showing drill traces and significant assay intercepts from recent Resource Definition Drilling. Current Mineral Resource outlines (red and green) and the Scoping Study AUD\$4,000/oz pit shell design (brown outline) are shown.

Figure 5: Mt Olympus cross section 592110mE looking west and centred on drill hole KADD0021 section showing drill traces and significant assay intercepts from recent Resource Definition Drilling. Current Mineral Resource outlines (red and green) and the Scoping Study AUD\$4,000/oz pit shell design (brown outline) are shown.

Mineralisation remains continuous within the main host sequence as the stratigraphy dips moderately to the south-east. Within this bedding-controlled mineralisation, the highest grades are generally developed closer to the main Zoe Fault feeder structure. The down-dip extent of the interbedded conglomerate and sandstone unit remains open to the south-east and will be tested in subsequent drilling programs.

High-grade Structural Controls

Drilling continues to define a series of structurally controlled, high-grade zones interpreted to represent feeder structures extending from the lower siltstone into the upper sedimentary sequence, including the principal interbedded conglomerate and sandstone unit. Further definition of high-grade mineralisation within the upper host sequence supports the interpreted vertical extent of these structures and highlights their importance as controls on the distribution of higher-grade mineralisation. A significant new intersection includes **20m @ 19g/t Au** from 2m in **KARC0206**.

The latest results are consistent with previous high-grade intersections from the lower siltstone, including **74m @ 4.1g/t Au** in KARC0145 and **36m @ 16g/t Au** in KARCD0146¹⁰. These earlier results identified multiple sub-vertical quartz-sulphide feeder structures sub-parallel to the main Zoe Fault.

Figure 6: Mt Olympus cross section 591980mE looking west and centred on drill hole KARC0206 section showing drill traces and significant assay intercepts from recent Resource Definition Drilling. Current Mineral Resource outlines (red and green) and the Scoping Study AUD\$4,000/oz pit shell design (brown outline) are shown.

The continued alignment of drilling results with this interpretation is improving understanding of the structural and lithological controls on mineralisation and strengthening confidence in the geological model. Mineral resource estimation work is underway, with the targeted release of an updated MRE in Q4 2026 remaining on track.

Further Drilling

Further drilling will target the intersection of the principal host lithologies with the Zoe Fault, which represents a key position for the development of higher-grade mineralisation. Planned Growth Drilling Programs will test the down-plunge and down-dip extensions of known mineralisation, including the open extent of the main host sequence to the south-east.

Pre-Feasibility Study

Work on the Mt Olympus Pre-Feasibility Study continues on schedule, with all major technical workstreams progressing.

The updated Mineral Resource, together with ongoing Growth drilling, will provide key inputs into mine optimisation, Ore Reserve estimation and project economics. The Company's objective remains to maximise the scale, mine life and value of the Ashburton Gold Project as it transitions from exploration to

development. Kalamazoo looks forward to providing further drilling and PFS updates as assay results are received and drilling progresses.

About Kalamazoo Resources Limited

Kalamazoo Resources Limited (ASX: KZR) is an ASX-listed exploration and development company with a portfolio of high-quality gold and base metals projects in the Central Victorian Goldfields, the Pilbara and the Murchison, WA. In the Pilbara, Kalamazoo is the 100% owner of 1.44Moz Ashburton Gold Project. Also, in the Pilbara the company is exploring its Mallina West Project which is located along strike of and within the same structural corridor as Northern Star's 11+ million ounce Hemi gold discovery. In the Central Victorian Goldfields Kalamazoo is exploring its 100% owned Castlemaine Goldfield Project (historical production of ~5.6Moz Au), the South Muckleford Gold Project south of the Maldon Goldfield (historical production of ~2Moz), the Myrtle Gold Project, the Tarnagulla Gold Project and the Mt Piper Gold Project near the world class Fosterville gold mine in Victoria.

Table 1: Mineral Resource Estimate for the Ashburton Gold Project⁷

1. OP (Open Pit) resource: >0.5 g/t, inside optimised pit Rev factor = 1.2
2. UG (Underground) resource: >1.5g/t below Rev factor = 1.2 pit, inside domain wireframes
3. West Olympus OP: >0.5 g/t, inside optimised pit Rev factor = 1.2
4. UG: >1.5g/t below Rev factor = 1.2 pit, inside domain wireframes
5. OP: >0.5g/t above 395mRL (equivalent to base of current pit)
6. OP: Optimised Pit 11 with Indicated + Inferred, > 0.5g/t
7. UG: Below Optimised pit >1.5g/t
8. The previous inferred resource at Romulus remains unchanged at 329kt @ 2.6g/t for 27k oz Au. Romulus was not included in this update and is therefore in addition to the total Resource quoted in the above table¹

Competent Persons Statement

The information in this release relating to exploration data and results for the Ashburton Gold Project is based on information compiled by Dr Benjamin Ackerman, a competent person who is a Member of The Australasian Institute of Geoscientists and Australasian Institute of Mining and Metallurgy. Dr Ackerman is a Director of Kalamazoo Resources Ltd. Dr Ackerman has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Dr Ackerman consents to the inclusion in this document of the matters based on his information in the form and context in which it appears.

The Company confirms that it is not aware of any further new information or data that materially affects the information included in the original market announcements by Kalamazoo Resources Limited referenced in this report and in the case of estimates of Mineral Resources, Exploration Targets, Production Target and forecast financial information derived from the production target disclosed in the Scoping Study dated 5 November 2025, that all material assumptions and technical parameters underpinning the estimates in the relevant market announcements continue to apply and have not materially changed. To the extent disclosed above, the Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

Forward Looking Statements

Statements regarding Kalamazoo's plans with respect to its mineral properties and programs are forward-looking statements. There can be no assurance that Kalamazoo's plans for development of its mineral properties will proceed as currently expected. There can also be no assurance that Kalamazoo will be able to confirm the presence of additional mineral resources/reserves, that any mineralisation will prove to be economic or that a mine will successfully be developed on any of Kalamazoo's mineral properties. The performance of Kalamazoo may be influenced by several factors which are outside the control of the Company and its Directors, staff, and contractors.

APPENDIX 1

Ashburton Gold Project (100% Kalamazoo): JORC Table 1

Section 1: Sampling Techniques and Data

Criteria	Commentary
Sampling techniques	Samples have been obtained from Rotary Air Blast (RAB), Reverse Circulation (RC), and diamond drilling (DD) methods. All RC and diamond core samples are of Paleoproterozoic sediments of the Mt McGrath Formation and underlying Cheela Basalt. Early drilling campaigns conducted by Sipa Mining (2002) deployed RAB drilling methodology, with sampling undertaken on 1m intervals down hole. The RC samples were taken with a rig-mounted static cone splitter with the aperture set to yield a primary sample of approximately 3kg for every metre. The splitter apparatus was cleaned regularly with compressed air via the sample hose between 1m samples and by washing with water at the end of each hole as a minimum. 3-4m composite samples of approximately 3kg were collected with a sampling tube from the 1m bagged RC drill cuttings. Wet, damp, or dry sample condition was recorded for each metre of RC drill cuttings based on visual inspection of the offcut sample bag. RC drilling to industry standards was used to obtain samples between 1m and maximum 5m length from which 3kg was pulverised to produce a 30g charge for fire assay. Diamond core was logged and either the entire hole sampled or extensively sampled with intervals selected based on geological position with minimum and maximum interval lengths of 0.5m and 1.2m respectively. The core sample interval was cut along the orientation line with a Corewise automatic core cutter and half-core sampled. Diamond core drilling to industry standards were used to obtain diamond core from which a half core sample between 0.5m and 1.2m length was pulverised to produce a 50g charge for fire assay.
Drilling techniques	RC drilling was carried out using a face sampling hammer and a 5-inch diameter bit. Diamond drilling was carried out from surface using 63.55mm diameter (HQ) barrel configurations and HQ reducing to 47.6mm diameter (NQ2) barrel configurations. Diamond core from inclined holes was orientated using an electronic core orientation tool every 6m or at closer spaced intervals in broken ground.
Drill sample recovery	Approximate recoveries for RC drill samples were recorded on formatted paper sheets as percentage ranges based on a visual estimate of the 1m offcut sample bag and entered and stored in the drillhole database. The majority of RC samples had 100% recovery. 25% of RC samples had recoveries of 50% to 90% and 10% of RC samples had recoveries >100%. Diamond core recovery is systematically recorded by the driller on core drill-run depth blocks and the length and location of core loss independently reconciled during core metre marking and the interval of core-loss recorded during logging and stored in the drillhole database. Core recovery was approximately 99.77%. Drilling parameters such as rotation speed, feed pressure and drilling fluid were adjusted as required to maximise recovery and accordingly, representativeness of the sample. The competent nature of the mineralisation and host rocks, combined with high recovery, indicates that sample bias due to preferential loss or gain of fine or coarse material is unlikely. The relationship between sample recovery and grade has not been investigated at the time of this report writing.
Logging	Core and chip samples have been logged by a qualified Geologist. Percussion hole logging is carried out on a metre by metre basis at time of drilling. All diamond holes were photographed before cutting, often as both wet and dry state. The logging is both qualitative and quantitative in nature. Historical logging is assumed of a similar standard. Diamond core was geologically logged at the time of drilling at interval lengths showing similar lithological characteristics. The logging was completed by a qualified Geologist to a level of detail to support appropriate Mineral Resource estimation, mining studies, and metallurgical studies. Geological logging recorded qualitative descriptions of lithology and mineralogy and quantitative descriptions of veining, sulphides, and lithology with visual estimates of percentages for sulphide and quartz. All diamond core is photographed after metre marking and before cutting and sampling and archived on site at the Ashburton Project. 100% of both RC drill chips and diamond core was logged.
Sub-sampling techniques and sample preparation	RC rig-mounted static cone splitter used for dry and wet 1m RC samples and a sampling tube used for dry and wet composite sampling. Pre-Kalamazoo RC sub sampling assumed to be at industry standard at that time. Both RC and diamond core samples are sorted at ALS Laboratory in Adelaide and weights recorded in LIMS. Any reconciliation issues (extra samples, insufficient sample, missing samples) are noted at this stage. Diamond core was cut with a Corewise automatic core saw and half core sampled on site at the Ashburton Project. Following drying at -45°C to constant mass, all samples below approximately 3kg are totally pulverised in LM5s to nominally 85% passing a 75µm screen. The few samples that are above 3kg are crushed to 95% passing 3mm and then riffle split to <3kg prior to pulverisation. The sample preparation technique is industry standard for Fire assay. Kalamazoo Resources Limited ("KZR") field QC procedures involve the use of high, medium and low grade gold certified reference standards inserted at a ratio of 1:20 and crushed feldspar blanks at 1:25 for standard sampling (0.5m – 1.2m for diamond core).

Criteria	Commentary
	Duplicate samples are taken at a ratio of 1:25 samples for standard sampling (0.5m – 1.2m for diamond core). Sample sizes are considered appropriate to the grain size of the material being sampled.
Quality of assay data and laboratory tests	For all RC and diamond core samples, gold concentration is determined by fire assay using the lead collection technique with a 50-gram sample charge weight. An ICP/OES finish is used to determine total gold. No geophysical tools or handheld pXRF were utilised in data capture for this core. The field QC protocols used include the following for drill samples: - Duplicate samples are taken from sample pulps for diamond core samples, at an incidence of 1:25 samples for standard sampling (0.5m – 1.2m for diamond core) and for RC samples duplicated are collected directly from the rotary cone splitter on the rig - Coarse crushed feldspar or basalt blanks are inserted at an incidence of 1:25 samples for standard sampling (0.5m – 1.2m for diamond core) - Commercially prepared certified reference materials (CRM) are inserted at an incidence of 1:20 samples for standard sampling (0.5m – 1.2m for diamond core) - The CRM used is not identifiable to the laboratory - Digital sample submission forms with sample identification numbers, number of samples and sample preparation and assay methods were provided to the lab with the samples The laboratory QC protocols used include the following for all drill samples: - Repeat analysis of pulp samples occurs at an incidence of 2 in 50 samples - Analysis of lab internal standards occurs at an incidence of 2 in 50 samples - Analysis of blank samples occurs at an incidence of 1 in 50 samples - Screen tests (percentage of pulverised sample passing a 85µm mesh) are undertaken on 1 in 50 samples The laboratory's own standards are loaded to the KZR database. KZR's QC data is assessed on import to the database and QC reports are generated after batches of assays have been loaded. The QC reports on the QC sample assay results indicate that an acceptable level of accuracy and precision has been achieved for the results reported.
Verification of sampling and assaying	The significant intercepts of gold mineralisation are not visually distinguishable in weathered rocks and in fresh rocks the percentage of pyrite and alteration does not directly correlate to the grade of gold mineralisation. The anomalous intersections have not been verified by alternative company personnel or independently since receipt of the assay results. There are no purpose twinned holes. Field data for diamond core drilling was recorded in Ocris software before periodic digital transfer and storage in the SQL database hosted by Rock Solid Data Consultancy Pty Ltd ("Rock Solid Data"). Rock Solid Data performs data QC checks before loading the data to the SQL database. No adjustments are made to assay data.
Location of data points	Collar positions were surveyed using a hire DGPS with better than 30cm accuracy and recorded in MGA2020 Zone 50 grid. Drill rig alignment was achieved using an Azi Aligner tool. Down hole surveys are taken every 30m with a True North seeking Gyro. Surveys were occasionally taken more frequently to monitor deviation. The grid system used for all spatial data reference is MGA2020 grid, zone 50. Topographic control is from the Rocket DNA May 2024 aerial photo and LiDar data.
Data spacing and distribution	The infill drilling program at Mt Olympus targeted a nominal drill spacing of 20m along strike and down plunge within the known mineralisation. Drill section spacings for the Mt Olympus growth drilling vary between 60m to 80m along strike down plunge of the Mt Olympus A\$4,000 pit shell. The current drill holes spacing down plunge of the Mt Olympus A\$4,000 pit shell is not considered sufficient for estimating Mineral Resources. The hole spacing at West Olympus and within the Scoping Study open pit limits is considered sufficient for estimating mineral resources. Sample compositing has not been applied. Samples are attained as a contiguous interval per sample. N/A.
Orientation of data in relation to geological structure	The orientation of sampling may be at a high angle to mineralisation due to several known orientations of structures and receptive strata that host mineralisation. All efforts are taken to ensure sampling is conducted to achieve an unbiased sample of mineralisation to the extent that this is known.
Sample security	All samples, both diamond and RC were bagged in tied numbered calico bags, and these were then bagged in larger cable tied numbered plastic poly weave bags in the core yard. The plastic poly weave bags were put in large durable nylon bulka bags in the core yard and tied with a sample submission sheet affixed to the side of the bulka bag. The bulka bags are transported via a register transport company to Adelaide with consignment note and receipted by an external and independent laboratory. All sample submissions were emailed to the laboratory, and hard copies accompanied the samples. All assay results were returned in digital format via email. Sample pulp splits are stored at a storage facility at the assay laboratory in Adelaide.
Audits or reviews	Routine laboratory audits are conducted on site, focussing on sample security, sample preparation, analysis, and reporting of analytical services. No material issues have been identified as a result of these inspections.

Section 2: Reporting of Exploration Results

Criteria	Commentary
Mineral tenement and land tenure status	Mining tenements M52/639, M52/640, M52/734 and M52/735 and exploration tenements E52/1941, E52/3024 and E52/3025 are wholly owned by Kalamazoo Resources Limited ("KZR") and are in good standing. The drilling program referred to in this announcement occurs within M52/639 and there are no heritage issues with the prospects or tenement. A 2% Net Smelter Royalty on the first 250,000 oz of gold produced and a 0.75% net smelter royalty is held by Northern Star Resources and a 1.75% royalty on gold production excluding the first 250,000oz is held by SIPA Resources ("SIPA"). The following tenure are held at the time of reporting, there are no known impediments to operating at the Ashburton Gold Project: - M52/639 was granted in 1996, renewed in 2018, now expiring on 27/05/2039 - M52/640 was granted in 1997, renewed in 2018, now expiring on 27/05/2039 - M52/734 was granted in 2001, expiring 08/05/2043 - M52/735 was granted in 2001, expiring 08/05/2043 - E52/1941-I was granted 14/09/2007, expiring 13/09/2027 - E52/3024 was granted in 2015, expiring 17/06/2027 - E52/3025 was granted in 2015, expiring 17/06/2027 - E52/4052 was granted in 2023, expiring 10/08/2028 - E52/4379 was granted in 2025, expiring 11/06/2030
Exploration done by other parties	Data relevant to this prospect was predominantly collected by SIPA who operated the Mt Olympus and West Olympus mines from start up to closure and by Northern Star Resources who completed considerable down-dip drilling at Mt Olympus and limited drilling at West Olympus as well as producing an updated Mineral Resource statement. KZR acquired a substantial drill hole and surface geochemical database from Northern Star Resources. Historical drill holes and surface stream, soil and rock chip samples within this database are regularly used by KZR and are part of its ongoing exploration activities.
Geology	The Mt Olympus and West Olympus deposits occur within the doubly plunging Diligence Dome and are hosted by the shallow basinal sediments of the Mt McGrath Formation. The West Olympus deposit is fault hosted and occurs in fine mudstone and locally dolomitic strata while the Mt Olympus Deposit develops within coarse sandstones and conglomerate in the footwall of the Zoe Fault. The deposits are considered to be sediment hosted gold deposits with mineralisation characterised by disseminated pyrite and argillic alteration with quartz veining typically poorly developed or absent.
Drill hole Information	As provided for KZR drilled holes. Historical drill hole information is provided in the drill hole database acquired from Northern Star Resources and reported on in the ASX:NST announcement on 7 February 2013. Exclusion of the historical drill information will not detract from the understanding of the report. QC audits have been undertaken by Northern Star Resources on the historical SIPA drill hole data and subsequent Northern Star Resources drilling was subject to internal QC checks prior to loading to the database.
Data aggregation methods	Significant intercepts in accompanying Drillhole Data tables are calculated by weighted averages with a minimum cut off of 0.3g/t Au, 1.0g/t Au (Resource Infill program) and a minimum cut off of 0.1g/t Au, 1.0g/t Au (Growth drilling program). No high cut was applied to the data and anomalously high maximum values were reported. Aggregate intercepts in Table 3 of the report are calculated by Rock Solid Data using the formulas; - Au >0.30ppm (0.3g/t Au) and minimum 8m downhole width with maximum consecutive internal dilution of 4m - Au >1.0ppm (1g/t Au) and minimum 4m downhole width with maximum consecutive internal dilution of 2m Continuous intervals which are greater or equal to 10 gram metres (Au_ppm x length) and weighted average Au > 2.5 g/t (2.5 ppm), with no internal dilution. The calculation method is stated in Appendix 1 above the intercept table. No metal equivalents are reported.
Relationship between mineralisation widths and intercept lengths	Significant intercepts are reported as down hole lengths. Interpreted cross sections are provided in the announcement to provide clarity on the geometry of mineralisation and any significant deviation from true width of mineralisation.
Diagrams	As provided.
Balanced reporting	Only intercepts that meet the intercept reporting criteria described in the Data aggregation methods section. All other results are considered No Significant Intercept (NSI).
Other substantive exploration data	There is no other meaningful exploration data to report.
Further work	KZR in nearing completion of a ~14,000 metre resource definition drilling program aimed at increasing confidence in the Mt Olympus resource model and supporting ongoing mining studies. Plan and long section figures provided indicate the areas of possible extensions at Mt Olympus down plunge and at West Olympus. Planning underway to target resource growth at Mt Olympus and potential expansions of resources at satellite orebodies including Peake, Zeus, and Waugh.

Drillhole Data

Mt Olympus, Ashburton Gold Project, Western Australia

Resource Definition Drilling Program

Reporting Criteria: Intercepts reported are downhole drill width (not true width) Au >0.30ppm (0.3g/t Au) and minimum 8m downhole width with maximum consecutive internal dilution of 4m. Average grades are based on length-weighting of samples grades. Also highlighted are higher grade intervals of Au >1.0ppm (1g/t Au) and minimum 4m downhole width with maximum consecutive internal dilution of 2m, and continuous intervals which are greater or equal to 10 gram metres (Au_ppm x length) and weighted average Au > 2.5 g/t (2.5 ppm), with no internal dilution are tabled. Gold grades are reported to two significant figures, the downhole lengths are rounded to 0.1m which may cause some apparent discrepancies in interval widths. Samples are from core drilling which is HQ or NQ in diameter and RC drill chips. Core is photographed and logged by the geology team before being cut. Half core HQ and NQ samples are prepared for assay and the remaining material is retained in the core farm for future reference. Each assay batch is submitted with duplicates, standards and blanks to monitor laboratory quality. Total depth (end of hole) is rounded to one decimal place for reporting purposes. Holes shown in **Bold** represent the recently returned assay results. Collars denoted with a * show partial results, with further significant assays to be reported in subsequent exploration updates.
