

Section 708A Cleansing Notice – Issue of Shares

MELBOURNE Australia, 30 September 2026 – Prescient Therapeutics (ASX: PTX), a clinical-stage oncology company developing targeted cancer therapies, lodges the following cleansing notice for the new ordinary shares:

The Company gives notice under Section 708A(5)(e) of the Corporations Act 2001 (Cth) (Corporations Act) that:

- (a) it issued 18,518,453 fully paid ordinary shares (**Shares**) to participants in the placement announced 23 September 2026;
- (b) the Shares were issued without disclosure to investors under Part 6D.2 of the Corporations Act;
- (c) the Company is providing this notice under paragraph 5(e) of section 708A of the Corporations Act;
- (d) as at the date of this notice the Company has complied with:
 - i. the provisions of Chapter 2M of the Corporations Act as they apply to the Company; and
 - ii. sections 674 and 674A of the Corporations Act; and
- (e) as at the date of this notice, there is no excluded information of the type referred to in Sections 708A(7) and 708A(8) of the Corporations Act which is required to be disclosed pursuant to section 708A(6)(e).

The Board of Prescient Therapeutics Limited has approved the release of this announcement.

About Prescient Therapeutics Limited (Prescient)

Prescient Therapeutics is a clinical-stage oncology company developing personalised cancer treatments through targeted therapies and advanced cell therapy enhancement platforms.

Targeted Therapy

PTX-100 is a first-in-class compound with the ability to block an enzyme that can contribute to cancer growth known as geranylgeranyl transferase-1 (GGTase-1). Blocking this target disrupts oncogenic Ras pathways by inhibiting the activation of Rho, Rac and Ral signaling circuits in cancer cells, leading to their apoptosis (death). Mutations in Ras pathways are believed to be involved in up to 22% of all cancers.

PTX-100 demonstrated safety and early clinical activity in a previous Phase 1 study and in a recent PK/PD basket study of hematological and solid malignancies. PTX-100 has recently completed a Phase 1b expansion cohort study in T-cell lymphomas, where it showed encouraging efficacy and safety. The US FDA has granted PTX-100 Orphan Drug Designation for all T-Cell Lymphomas and Fast Track Designation for the treatment of adults with relapsed or refractory (r/r) mycosis fungoides, the most common subtype of CTCL. The Phase 2 study in r/r Cutaneous T-cell lymphoma (CTCL) is recruiting globally. With 20 evaluable patients (10 in each dosing arm) now enrolled, the first Dose Optimisation Committee review will take place in December 2026. Enrollment continues towards the planned 40 evaluable patients.

Cell Therapy Platforms

OmniCAR: is a universal immune receptor platform enabling controllable T-cell activity and multi-antigen targeting with a single cell product. OmniCAR's modular CAR system decouples antigen recognition from the T-cell signalling domain. It is the first universal immune receptor allowing post-translational covalent loading of binders to T-cells. OmniCAR is based on technology licensed from Penn; the SpyTag/SpyCatcher binding system licensed from Oxford University; and other assets. OmniCAR is in preclinical development.

The targeting ligand can be administered separately to CAR-T cells, creating on-demand T-cell activity post infusion and enables the CAR-T to be directed to an array of different tumour antigens. OmniCAR provides a method for single-vector, single cell product targeting of multiple antigens simultaneous or sequentially, whilst allowing continual re-arming to generate, regulate and diversify a sustained T-cell response over time.

CellPryme-A: CellPryme-A is an adjuvant therapy designed to be administered to patients alongside cellular immunotherapy to help them overcome a suppressive tumour microenvironment. CellPryme-A significantly decreases suppressive regulatory T cells; increases expansion of CAR-T cells in vivo; increases tumour penetration of CAR-T cells. CellPryme-A improves tumour killing and host survival of CAR-T cell therapies, and these benefits are even greater when used in conjunction with CellPryme-M pretreated CAR-T cells.

CellPryme-M: Prescient's novel, ready-for-the-clinic, CellPryme-M technology enhances adoptive cell therapy performance by shifting T cells towards a central memory phenotype, improving persistence, and increasing the ability to find and penetrate tumours. CellPryme-M is a 24-hour, non-disruptive process during cell manufacturing. Cell therapies that could benefit from additional productivity in manufacturing or increased potency and durability in-vivo, would be good candidates for CellPryme-M.
