archTIS and Pexip Partner to Deliver Real-Time, Clearance-Based Access Control for Secure Video Collaboration

archTIS Trusted Data Integration to dynamically secure mission-critical defence collaboration on the Pexip Infinity video conferencing platform

archTIS Limited (ASX:AR9, OTCQB:ARHLF) (“archTIS” or the “Company”), a leading provider of innovative software solutions for the secure collaboration of sensitive information, and Pexip, a provider of secure, customizable video collaboration for defense and government organizations, today announce a strategic partnership to integrate archTIS Trusted Data Integration (TDI) with Pexip Secure Meetings. The combined offering integrates archTIS’ real-time, attribute-based access control capabilities with Pexip’s video conferencing, a capability long requested by defense, intelligence, and regulated government customers.

The joint solution uses archTIS TDI to enforce nationality and security-clearance rules on the Pexip Infinity platform, including the ability to admit, deny, or remove participants mid-call. The integration enables Pexip to dynamically issue a policy request to archTIS TDI each time a participant attempts to join a conference. archTIS TDI reads the participant’s attributes, including nationality and clearance, from the customer’s identity provider (e.g., Microsoft Entra ID), translates country-specific clearance codes into a common STANAG 4774 classification (such as TOP SECRET, SECRET, PROTECTED, or OFFICIAL), and evaluates them against the meeting’s required level encoded in a service tag (for example, SEC=SECRET). Participants who meet or exceed the requirement are admitted; those who do not are denied with a reason. If a participant’s attributes change during a session, the system can remove them immediately.

Built for allied and coalition operations

The partnership addresses a long-standing gap for defence organizations operating under multinational classification regimes. Video conferencing platforms have traditionally relied on meeting links, PINs, or lobby controls to manage who joins a call, none of which evaluate a user’s real-time clearance, nationality, or need-to-know principles. By combining Pexip Infinity’s video conferencing capabilities and deployment flexibility (on-premises, sovereign cloud, or hybrid) with archTIS TDI’s attribute-based policy engine, customers can run multinational meetings with the confidence that every participant is continuously authorized regardless of infrastructure.

Executive Perspective

Jordan Owens, CTO Americas, Pexip, “For defense organizations, the policy governing a meeting should come from the same systems that govern the rest of their mission environment. Pexip makes those policies actionable in video. By integrating with archTIS, we enable organizations to extend their established access controls to conferences and participants, while retaining ownership of the rules and data behind every decision.”

Kurt Mueffelmann, Chief Strategy Officer and U.S. President, archTIS, “Competing conference tools are limited to basic validation, such as a link to the call and potentially a password. Pexip and archTIS TDI elevate the enforcement point to the meeting itself, validating clearance,

14 October 2026

nationality and need-to-know authorization prior to entry to secure mission-critical communications.”

Availability

The archTIS TDI integration for Pexip is available immediately from both Pexip and archTIS. Proof-of-concept engagements are underway with several allied government customers.
