ASX Announcement

30 October 2026

QUARTERLY ACTIVITIES REPORT: SEPTEMBER 2026

This announcement is available to read on the Northern Minerals Investor Hub. Sign up to stay connected to Northern Minerals and receive alerts when new announcements are released.

HIGHLIGHTS

ENVIRONMENTAL, SOCIAL AND GOVERNANCE

- No lost time injuries were recorded during the quarter, with Total Recordable Injury Frequency Rate (TRIFR) reducing from 11.6 in July 2026 to 10.52 at 30 September 2026.
- The Browns Range Heavy Rare Earths Project (Browns Range or the Project) Mine Development and Closure Plan was approved on 30 July 2026 and the Company received notice of the decision to grant the Main Infrastructure Works Approval after the reporting period on 22 October 2026. This completes the approvals required to commence construction of the Project.

ADVANCING BROWNS RANGE TOWARDS A FINAL INVESTMENT DECISION

- The Project continued to progress through Front-End Engineering and Design (FEED), approvals, procurement and construction-readiness activities. Final Investment Decision (FID) and subsequent execution remain subject to completion of the Company's funding arrangements.
- Evaluation of the Dazzler deposit as a potential future feed source alongside the Wolverine deposit progressed during the quarter.
- Capital and operating cost estimates were reviewed using recent tender pricing. Based on the current review, capital cost increases since December 2024 are broadly in line with Western Australian mining inflation, while the Project continues to target first concentrate production in Q1 2029, subject to completion of the Company's funding arrangements.

EXPLORATION AND GROWTH

- Regional target generation progressed from data acquisition and processing to integrated target generation and ranking across both the Browns Range and Coomarie Dome project areas. A significant development during the quarter was the renewed focus on the Coomarie Dome, approximately 120 km south of Browns Range.

- Ultra Fine Fraction (UFF) geochemical surface sampling confirmed coherent yttrium anomalies associated with Dazzler, Vulcan, Banshee and Mystique, and identified several additional anomalies requiring follow-up assessment.
- The Vulcan prospect diamond drilling program was completed during the quarter, with assays outstanding at quarter end.

CORPORATE

- As at 30 September 2026, Northern Minerals held total cash and investments of $20.5M, comprising $19.0M in cash and cash equivalents and $1.5M in term deposits with original maturities greater than 90 days. While these term deposits are not classified as cash equivalents for accounting purposes, they are available to be converted to cash upon 31 days' notice, and all are due to mature within the next two quarters.
- Project funding discussions continued with Australian and US Government financing agencies in support of the Project's development.
- Following the 2 July 2026 deadline under the Federal Treasurer's May 2026 disposal orders, Northern Minerals continued to assist the Foreign Investment Review Board (FIRB) and Treasury in assessing compliance with those disposal orders. The Treasurer issued further directions during the quarter in relation to the voting and disposal of certain shares, and the timing of the Company's 2025 AGM was further deferred to allow the compliance process to progress.

QUARTERLY ACTIVITIES REPORT

Australian heavy rare earths-focused company Northern Minerals Limited (ASX: NTU) (Northern Minerals or Company) is pleased to present its Quarterly Activities Report for the period to 30 September 2026, to accompany the Appendix 5B.

Northern Minerals' primary focus during the quarter was to advance its 100%-owned Browns Range Heavy Rare Earths Project (Browns Range or Project), in the East Kimberley region of Western Australia. Browns Range is one of the world's most significant and advanced heavy rare earths development opportunities outside of China.

No substantive mining production or mine development activities were undertaken during the quarter. Northern Minerals remains focused on advancing Browns Range towards FID. FID and subsequent execution activities remain subject to completion of the Company's funding arrangements. First concentrate production is targeted for Q1 2029.

Commenting on the Quarter's activities, Northern Minerals Executive Chairman, Adam Handley, said:

"The September quarter was focused on progressing the work required to move Browns Range towards FID. We advanced engineering, approvals, procurement and field investigations while continuing the review of Project capital and operating cost estimates using recent tender pricing.

"Achieving FID and commencing execution remain subject to completion of the Company's funding arrangements, which continue to be a key priority. The Project continues to target first concentrate production in Q1 2029.

"We also progressed the evaluation of Dazzler as a potential future feed source alongside Wolverine and continued regional exploration across Browns Range and Coomarie Dome. I thank the Northern Minerals team and our contractors for their continued efforts during the quarter."

ENVIRONMENTAL, SOCIAL AND GOVERNANCE

SAFETY

No lost time injuries were recorded during the quarter. TRIFR was 11.6 in July, 10.68 in August and 10.52 at 30 September 2026. Project field activities were supported by contractor engagement, daily safety meetings, leadership inspections, traffic management reviews and an emergency evacuation exercise.

HERITAGE

Northern Minerals maintained ongoing engagement with Traditional Owners and local communities throughout the quarter. Jaru Cultural Heritage Monitors supported water bore drilling, test pitting and related field programs, helping ensure project activities were undertaken in accordance with agreed heritage management processes.

Heritage surveys were conducted in September over the remaining un-surveyed areas within the proposed Project disturbance footprint. Ten Traditional Owners and two archaeologists participated in the survey with NTU attending.

Figure 1 – Heritage Survey

ENVIRONMENTAL COMPLIANCE

Environmental activities during the quarter focused on compliance and field controls supporting water bore drilling and geotechnical investigations of the tailings storage facility, waste rock landforms and pond facilities from the Browns Range Pilot Plant facilities completed by Knight Piésold.

Figure 2 – Geotechnical waste rock landform compliance monitoring

APPROVALS AND PROJECT READINESS

During the quarter, key regulatory approvals were obtained in support of construction readiness. The Mine Development and Closure Plan was approved on 30 July 2026, authorising ground disturbance for the main Project together with existing approvals. The Department of Water and Environmental Regulation (DWER) issued draft conditions for the Main Infrastructure Works Approval on 27 August 2026 and, following Northern Minerals' response, DWER granted its approval on 22 October 2026. This now completes the approvals required to commence construction of the main Project infrastructure for the Browns Range Heavy Rare Earths Project.

Following receipt of data and information from the field water drilling program, a request to amend the current water licence was submitted to DWER on 24 September 2026 to support increased borefield abstraction and reuse of Wolverine pit dewatering during construction. The amendment, once approved, accommodates the increased water demand during construction and early operations for the Project.

Biological survey work supporting future approvals for the Dazzler deposit progressed during the quarter. Baseline vertebrate fauna and short-range endemic survey reports remained in preparation for inclusion in the planned Part IV Environmental Protection Act application.

Lateral Environmental was engaged by the Company to conduct baseline surveys of the Project area for aquatic invertebrates. The study results will support an upcoming application to the Environmental Protection Authority (EPA) seeking approval to discharge excess mine dewatering to an ephemeral drainage line. The Lateral study involves two seasonal surveys; one completed in the wet season in 2025 and one in the dry season in 2026. The 2026 dry season survey sampled 9 locations within and surrounding the Project. Field samples of water quality, soils, habitat types and fauna will be assessed and a report provided to Northern Minerals in time to be included with the EPA application.

Figure 3 – Lateral Environmental completing an Aquatic Invertebrate study

DEVELOPMENT

The Browns Range Heavy Rare Earth Project continued to advance through FEED during the quarter. Activities focused on progressing engineering and approvals, completing field investigations, continuing the process of reviewing capital and operating cost estimates, advancing procurement and improving construction readiness. FID and subsequent execution activities remain subject to completion of the Company's funding arrangements.

ENGINEERING AND FEED

Engineering and FEED activities progressed across the principal infrastructure packages. Camp and non-process infrastructure design progressed towards 30% completion. Issued for Construction earthworks design continued for the Main Access Road and site-wide works, with completion expected in October 2026 following incorporation of Northern Minerals' comments and geotechnical inputs.

Detailed design of the Wolverine diversion drain commenced during September 2026. Design scopes and commercial terms for the airstrip and tailings storage facility were also substantially agreed.

Capital and operating cost estimates were reviewed using recent tender pricing for nine major contract packages. Based on the current review, since December 2024 capital costs have increased broadly in line with the Western Australian mining inflation rate of approximately 6% to 8% per annum, while operating costs have increased by approximately 3% to 4% per annum.

GEOTECHNICAL INVESTIGATION PROGRAM

The geotechnical field investigation program was completed during the quarter. Activities included drilling, test pitting, Dynamic Cone Penetration, Electrical Resistivity Tomography and Multichannel Analysis of Surface Waves surveys. Borrow-source investigations were also completed along the Main Access Road.

At quarter end, laboratory testing and final geotechnical reporting remained outstanding and continued into the December quarter. This work will confirm earthworks, pavement and foundation design parameters and assess approximately 150,000 bank cubic metres of potential borrow material.

Geotechnical samples from the underground mining infrastructure drilling program were also tested during the quarter, with the results being analysed to support box cut design.

Figure 4 – Multichannel Analysis of Surface Waves testing at the proposed tailings storage facility location

WATER SUPPLY AND HYDROGEOLOGICAL STUDIES

The water-bore drilling and pump-testing programs were completed during the quarter. Three production bores and associated monitoring bores were completed, with pump testing confirming sufficient yield for the Project water supply. The Wolverine West dewatering discharge monitoring bore was also completed during the quarter.

No viable water bores were identified along the access-road alignment. Water for road construction will therefore be supplied by pipeline or carted to the workfront. This is not expected to have a material effect on Project capital costs.

The groundwater-model update commenced during the quarter, together with supporting technical work for environmental approvals and final water-supply design.

Figure 5 – Pump Testing of New Bores

MINING STUDIES AND TECHNICAL OPTIMISATION

Mining studies advanced across the proposed Wolverine open pit and Wolverine underground development options during the quarter. Tender submissions were evaluated and contractor pricing was incorporated into the review of capital and operating cost estimates.

For the proposed Wolverine underground mine development option, cave hydrogeological modelling and ventilation studies progressed during the quarter. The final radiation assessment concluded that workforce exposure would represent a low risk with appropriate ventilation controls in place. A Radiation Management Plan and Ventilation Management Plan will be developed as part of the Project's operational readiness procedures.

WOLVERINE-DAZZLER EVALUATION

Evaluation of the Dazzler deposit as a potential future feed source alongside the Wolverine deposit progressed during the quarter

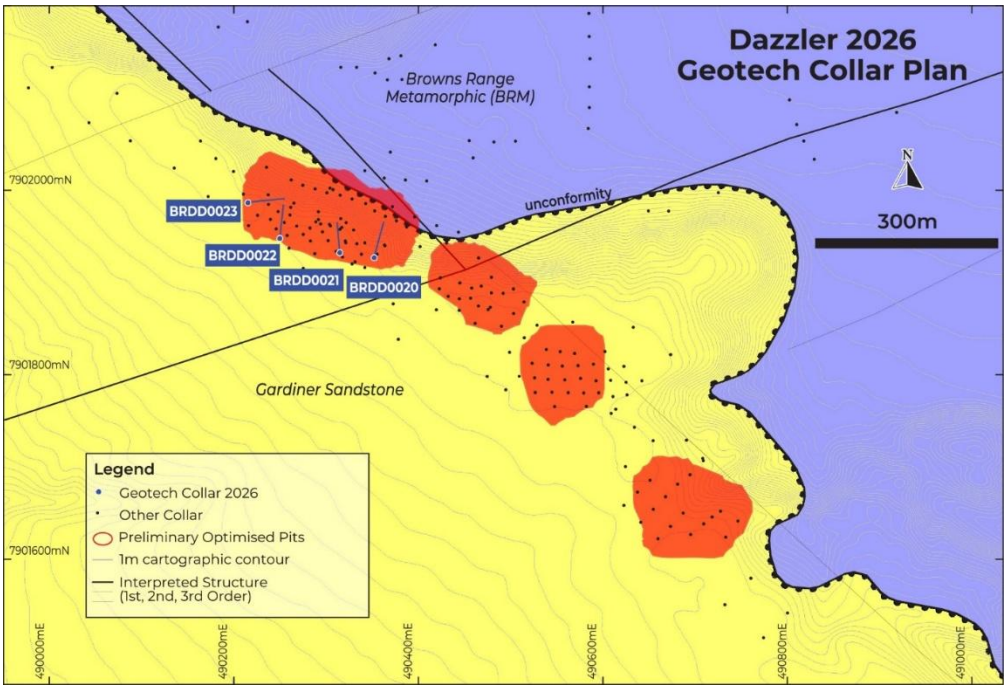

Open pit optimisation commenced, supported by geotechnical logging, sampling and laboratory testing of material from four geotechnical diamond drill holes within the Dazzler Main Zone. Waste-rock characterisation was completed, while geotechnical analysis and hydrological assessment continued to support mine planning.

Metallurgical testing also progressed to evaluate variability across nine Wolverine-Dazzler blends and a Wolverine baseline composite. Settling tests indicated that the flocculant and coagulant products selected for Wolverine were also suitable for Wolverine-Dazzler blends, although higher dosages may be required due to Dazzler's clay content.

Further testing included grind establishment, size-by-assay, low-intensity magnetic separation, wet high-intensity magnetic separation and flotation. Remaining assay results and selected repeat magnetic-separation tests are expected during the December quarter.

The results of this work will inform mine planning and the continuing evaluation of Dazzler's potential integration with Wolverine.

Figure 6 – Dazzler geotechnical drill-hole locations and preliminary optimised open pits

METALLURGICAL AND PROCESS DEVELOPMENT ACTIVITIES

Metallurgical and process development activities for Wolverine progressed during the quarter to confirm process-design assumptions.

For Wolverine, verification sizing of the magnetic-separation tailings confirmed that the material used in earlier dynamic thickener testing was consistent with the expected particle-size distribution. Dynamic thickener testing of magnetic and flotation concentrates commenced, with completion and reporting scheduled for the December quarter.

CONSTRUCTION READINESS ACTIVITIES

Construction readiness activities focused on completion and close-out of the water supply and geotechnical field programs, together with mobilisation planning, site access, permitting, construction staging and interface coordination for upcoming early works and execution packages.

Main Roads WA, in partnership with the Shire of Halls Creek, continued upgrades to Duncan Road and Gordon Downs Road to improve road safety, drainage and wet-season access to Browns Range. Remaining Duncan Road works were scheduled for completion by the end of 2026.

PROJECT SCHEDULE

At 30 September 2026, FEED earned-value progress was 65.9%, compared with planned progress of 78.0%, representing a variance of 12.1 percentage points. The Project schedule continues to target first concentrate production in Q1 2029.

The near-term schedule focus is completion of the Process Plant engineering, procurement and construction contracting and award process, coordination of site-wide earthworks interfaces and long-lead procurement. Award of the Process Plant engineering, procurement and construction contract remains scheduled for March 2027, followed by construction, installation and commissioning activities supporting the targeted production of first concentrate in Q1 2029.

DEVELOPMENT EXPENDITURE

FEED cost to date at 30 September 2026 was $7.22 million. Material expenditure during the quarter was concentrated on:

- Water bore drilling and hydrogeological investigations.
- Geotechnical drilling and site investigations.
- Engineering and IFC design activities.
- Procurement and tendering activities.
- Project management and FEED support services.
- Environmental approvals and supporting studies.

Cash expenditure on FEED activities during the quarter was approximately $4.57 million, with an additional $1.93 million in site costs.

PROCUREMENT ACTIVITIES

Procurement advanced across FEED, FID-critical and execution packages during the quarter. Tender reviews, normalised pricing, technical and commercial clarifications, financial-capacity

assessments and recommendations for award progressed for bulk earthworks, power supply, the Process Plant engineering, procurement and construction contract, raw-water supply, mining services, camp and non-process infrastructure, laboratory services and camp services.

At quarter end, tender evaluation for the tailings storage facility and airstrip IFC design was complete, surveying services remained under evaluation and major execution packages continued towards award in line with the delivery schedule. Contracts awarded before FID will remain subject to conditions precedent, including FID and acceptable Project financing.

PROJECT RISKS, ISSUES AND MITIGATIONS

The principal near-term Project risks are completion of funding arrangements, timely close-out and award of major execution packages, progression of groundwater and Part IV Environmental Protection Act approvals, completion of outstanding FEED deliverables and management of interfaces between earthworks, camp, mining, process plant and commissioning activities.

These risks are being managed through ongoing engagement with funding and technical parties, regulator consultation, tender evaluation and commercial alignment, integrated schedule reviews and completion of outstanding field-investigation reporting and design inputs.

Regulatory approval timing remains a risk, for the proposed discharge of mine dewatering water. The groundwater licence amendment and Part IV Environmental Protection Act application are progressing, with Northern Minerals continuing to engage with regulators to support the Project schedule and meet applicable compliance requirements.

ACTIVITIES PLANNED FOR THE DECEMBER 2026 QUARTER

The primary focus for the December quarter will be completion of the remaining FEED deliverables and progression of funding, approvals, procurement and construction-readiness activities. Key priorities include:

- progressing the groundwater licence amendment and Part IV Environmental Protection Act application;
- completing geotechnical and hydrogeological reporting;
- advancing earthworks, camp, tailings storage facility, airstrip and water-supply design;
- closing out major tender evaluations and recommendations for award;
- progressing Dazzler evaluation, mine planning and metallurgical variability analysis; and
- maintaining alignment between funding, procurement and the execution schedule.

EXPLORATION AND GROWTH

Exploration activities during the quarter focused on regional target generation across Browns Range and Coomarie Dome, interpretation of UFF soil sampling results and completion of diamond drilling at the Vulcan prospect.

REGIONAL TARGET GENERATION

Regional target-generation activities during the quarter focused on the Browns Range and surrounding volcano-sedimentary sequences across Western Australia and the Northern Territory, together with the western margin of the Coomarie Dome. Geological, geophysical,

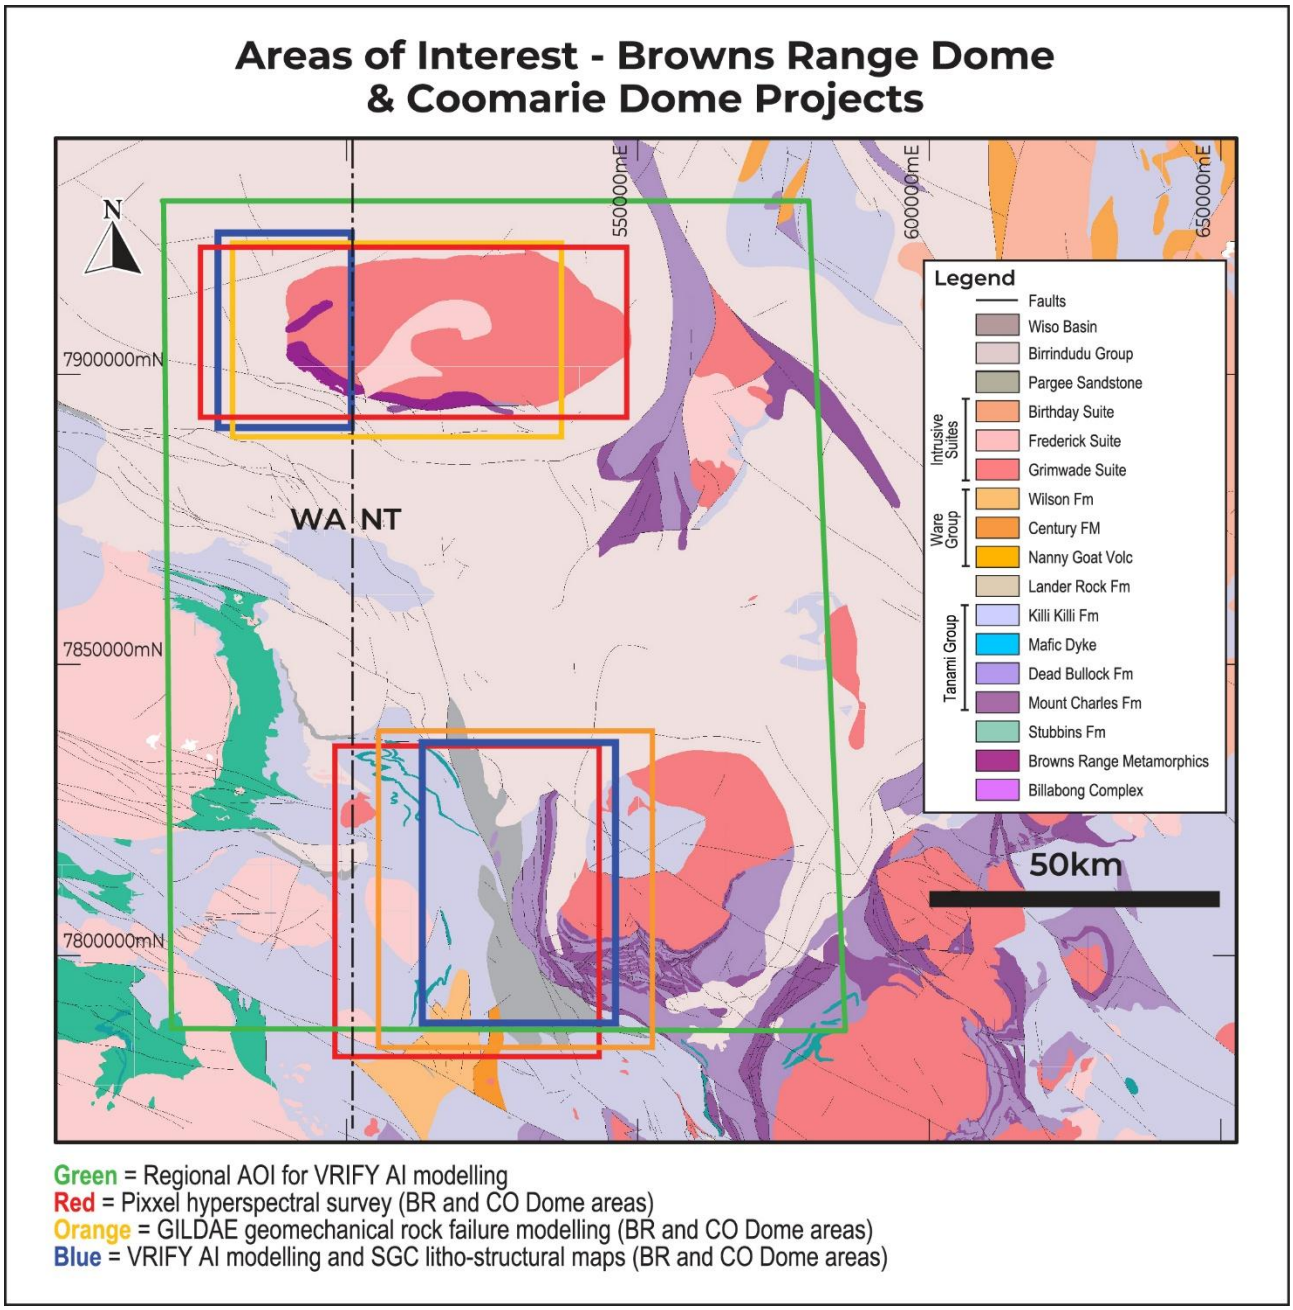

geomechanical, hyperspectral and geochemical datasets were integrated to refine the Company's regional HREE mineral systems model and identify prospective structural settings.

A detailed litho-structural interpretation of the southern margin of Browns Range was completed during the quarter. The interpretation identified and ranked a series of targets using structural setting, geomechanical modelling, geophysical information, hyperspectral imagery and UFF soil geochemistry. This work supported further refinement of the GMEX 1 target, approximately 2 km northeast of the Cyclops deposit, which was approved for the Western Australian Government's Exploration Incentive Scheme Round 34 Co-funded Drilling Program.

Regional target generation also progressed at Coomarie Dome, where geomechanical modelling was completed and regional geophysical, geological and hyperspectral datasets were assembled for integrated assessment. Priority areas identified from this work are being evaluated against complementary exploration information.

Preliminary artificial intelligence modelling using the VRIFY DORA platform was undertaken during the quarter. Geological, geophysical, geochemical, hyperspectral and geomechanical datasets for Browns Range and Coomarie Dome are being integrated within the platform to support the identification and ranking of regional HREE exploration targets. Preliminary outputs are being assessed alongside the Company's geological interpretations and other exploration information before targets are prioritised for field assessment.

Figure 7 – Regional geological map of the Tanami region (from Blaikie et al., 2021) with coloured rectangular outlines defining Areas of Interest (AOI) of recent exploration initiatives for the Browns Range Dome and Coomarie Dome Project areas.

SURFACE GEOCHEMICAL SAMPLING

OVERVIEW

Analytical results from the UFF soil sampling program completed during the previous quarter were received, validated and integrated with earlier UFF datasets during the reporting period. The program was designed to expand geochemical coverage across the southern Browns Range Project, assess the effectiveness of UFF geochemistry and support regional HREE target generation.

A total of 1,436 exploration samples from the program completed during the previous quarter were analysed and incorporated into the interpretation during the reporting period. The results were combined with previous UFF surveys to generate a consolidated regional dataset comprising 2,343 exploration samples.

INTERPRETATION

Multielement statistical analyses were completed to identify geochemically coherent element associations and develop exploration indices representing geologically meaningful assemblages. This analysis identified a consistent yttrium-heavy rare earth element (Y-HREE) association across the survey area. Y-HREE anomalies coincide with several known HREE prospects and mineralised systems, including Dazzler, Vulcan, Banshee and Mystique.

The spatial association between Y-HREE anomalism and known HREE mineralisation supports the use of UFF geochemistry as an effective regional exploration tool at Browns Range. However, the significance of Y-HREE anomalism that is not spatially associated with known mineralisation is yet to be established through subsequent exploration programs.

Several coherent Y-HREE anomalous populations were identified within the survey area where no HREE prospects are currently defined. Unlike some of the relatively discrete anomalies associated with known mineralised systems farther south, several of the new anomalies have limited correspondence with interpreted geology and structural controls. These anomalies show a spatial relationship with topographic lows and modelled drainage pathways and require field validation.

BROADER GEOCHEMICAL INTERPRETATION

The broader multielement dataset also identified geochemical signatures relevant to the underlying lithological architecture. Mafic-ultramafic geochemical indices, principally characterised by chromium, vanadium, nickel and variably scandium associations, define several litho-geochemical domains across the coverage area.

The spatial correspondence between independent geochemical and geophysical datasets indicates that UFF sampling is capable of preserving a measurable geochemical expression of underlying bedrock geology despite modification within the weathering profile and surficial environment. This provides an additional litho-geochemical constraint for interpreting regional signatures and distinguishing primary geological controls from secondary dispersion processes.

FURTHER WORK

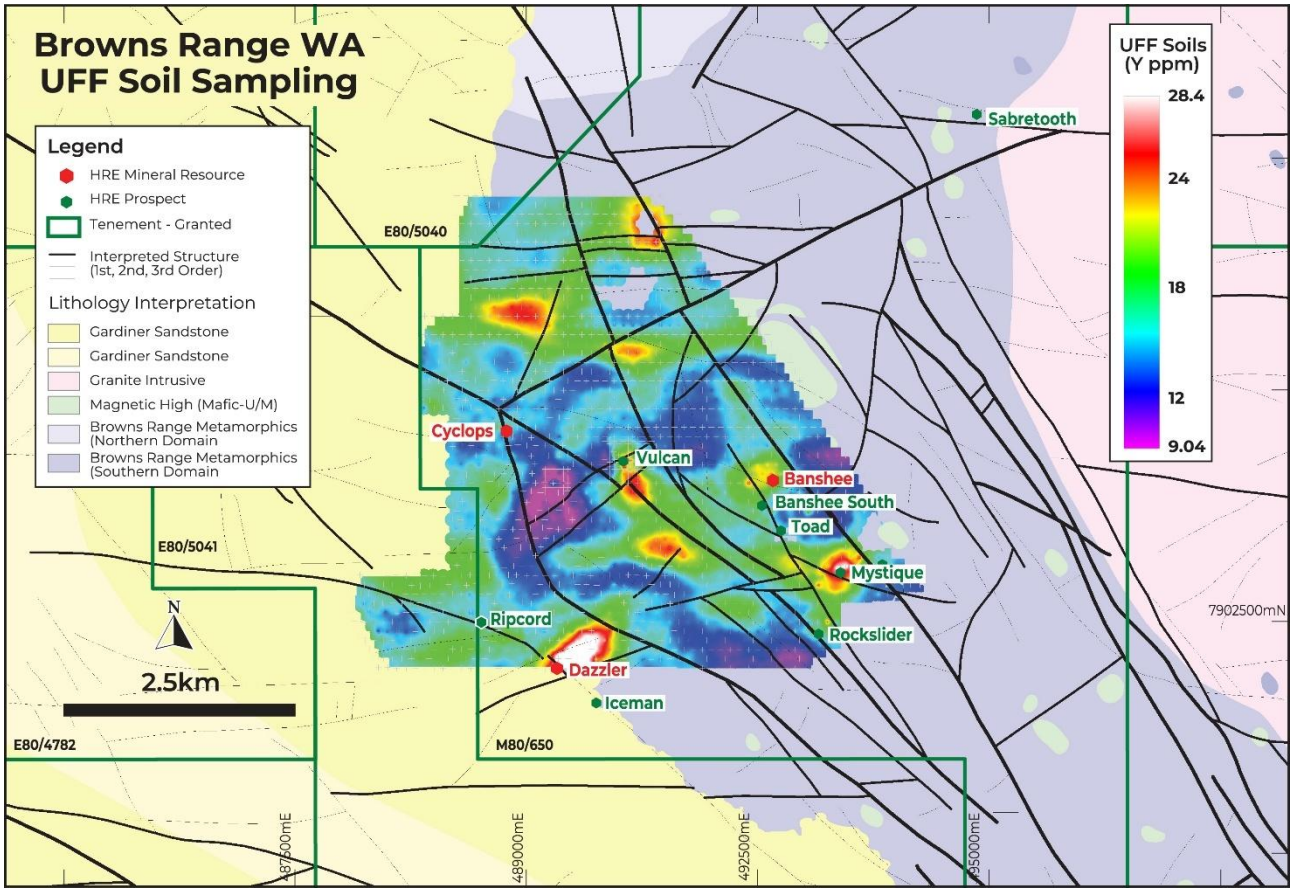

The results demonstrate the effectiveness of UFF soil geochemistry as an exploration technique within the Browns Range environment. The survey successfully reproduces multiple known HREE prospects and mineralised systems, providing strong validation of the technique, while also identifying additional Y-HREE anomalism beyond currently recognised areas of prospectivity. Furthermore, the dataset demonstrates the capacity of UFF geochemistry to contribute to broader lithological and mineral-system mapping across the project area.

Further work will focus on:

- refining the interpretation of the new Y-HREE anomalism;
- assessing the influence of drainage, landscape evolution and other surface processes;
- evaluating hydrothermal and pathfinder element associations;

- integrating the UFF results with geological and geophysical information; and
- prioritising areas for follow-up exploration.

Figure 8 – Amalgamated Ultrafine Fraction soil sampling results (2025-2026), southern Browns Range WA, gridded for Yttrium parts per million.

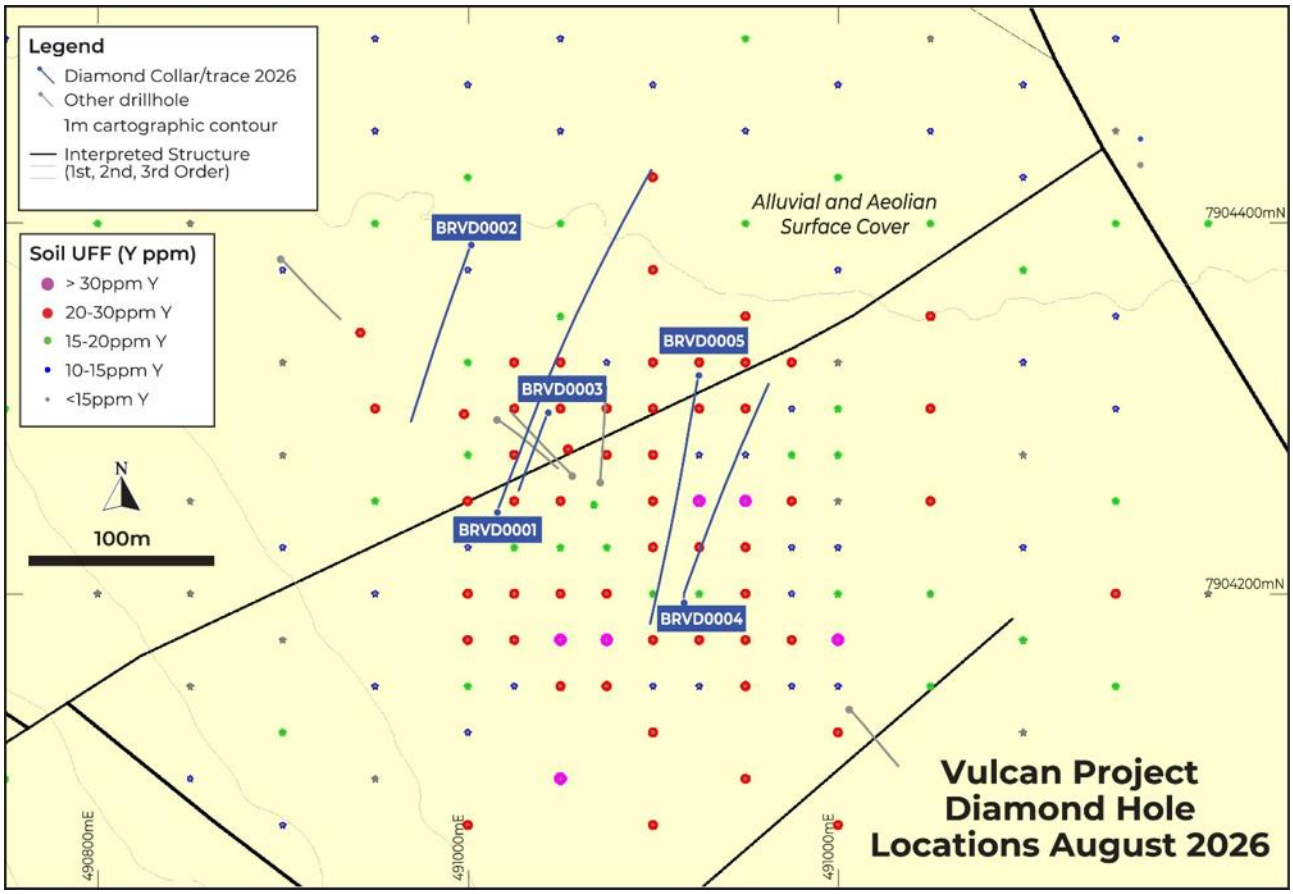

VULCAN PROSPECT DIAMOND DRILLING PROGRAM

A follow-up diamond drilling program comprising five holes for 1,201.5 m was completed at the Vulcan prospect to evaluate structural targets interpreted from geophysical data as potential pathways for HREE mineralisation.

All holes intersected the targeted mafic volcanic sequence, with minor zones of brecciation and veining recorded. Structural measurements from drill core indicate the brecciated zones are oriented northwest-southeast and may be relevant to the exploration model. Assessment of the geological significance of these observations remains subject to receipt and interpretation of assay results, which remained outstanding as at 30 September 2026.

Figure 9 – Completed diamond hole collars and traces, Vulcan prospect, with UFF soil sampling results overlay.

NEXT STEPS

Exploration activities during the December quarter will focus on advancing the regional exploration activities, including completion and interpretation of integrated geological, geophysical, hyperspectral and geochemical datasets across the Western Australia and Northern Territory tenement package. Data compilation and multivariate data uploads to the VRIFY DORA AI platform will continue, with initial AI-assisted targeting outputs expected to support the identification and ranking of new exploration targets.

Further interpretation of the UFF results will continue, including assessment of the results acquired to date. Expansion of the surface geochemical sampling area is planned for the December quarter.

Analysis and interpretation of the Vulcan diamond drilling assay results will be conducted once all results are received, assessing potential follow-up work.

EXPLORATION EXPENDITURE

Expenditure on exploration and evaluation activities during the quarter was approximately $2.46 million.

CORPORATE

CASH AND INVESTMENTS

As at 30 September 2026, Northern Minerals held total cash and investments of $20.5M, comprising $19.0M in cash and cash equivalents and $1.5M in term deposits with original maturities greater than 90 days. While these term deposits are not classified as cash equivalents for accounting purposes, they are available to be converted to cash upon 31 days' notice and all are due to mature within the next two quarters.

FUNDING ACTIVITIES

Northern Minerals progressed discussions with US and Australian funding agencies during the quarter. The discussions follow the signing of the Critical Minerals and Rare Earths (inc. Heavy Rare Earths) Framework Agreement by US President Trump and Prime Minister Albanese in October 2025, and the Company receiving a:

- non-binding Letter of Interest from the Export-Import Bank of the United States (EXIM); and
- non-binding, conditional Letter of Support from Export Finance Australia for the Project.

The non-binding, conditional letter of interest from the Export-Import Bank of the United States announced on 21 October 2025, under which EXIM indicated it could consider debt financing of up to US$230 million, was issued for EXIM's standard one-year term, which ended on 21 October 2026. EXIM's terms provide for a letter of interest to be renewed for a further year. The Company has requested renewal and EXIM is currently performing its standard due diligence review process. The non-binding, conditional letter of support from Export Finance Australia, also announced on 21 October 2025, remains in place. Neither letter is or was a commitment.

FIRB AND ANNUAL GENERAL MEETINGS

Following the 2 July 2026 deadline under the Federal Treasurer's May 2026 disposal orders, Northern Minerals provided relevant share registry information to FIRB to assist the Treasurer and FIRB in determining compliance with the orders. The Company subsequently announced that a majority of the shares subject to the disposal orders remained registered in the names of the persons subject to those orders.

During the quarter, the Treasurer issued further interim directions in relation to certain shares subject to the disposal orders. These included restrictions on the exercise of voting and other rights and, subsequently, additional requirements relating to the disposal and registration of transfers of certain shares.

The Company initially announced that its deferred 2025 AGM would be held on 30 September 2026. Following further relief granted by ASIC, the timeframe for holding the 2025 AGM was extended to 30 November 2026 or, if earlier, within 42 business days after formal notification from Treasury that it considered the May 2026 disposal orders had been fully complied with. On 30 September 2026, the Company announced that the 2025 AGM and 2026 AGM were scheduled to be held on 25 November 2026, unless otherwise deferred.

After the quarter end, on 19 October 2026, the Company announced that ASIC had granted Northern Minerals an extension of time to hold the 2025 AGM and 2026 AGM. The Company must hold the 2025 AGM and the 2026 AGM by 31 March 2027 or within 42 business days of being formally notified by Treasury that it considers the May 2026 disposal orders have been fully complied with, whichever is earlier.

EXTERNAL AUDITOR

The Company previously announced that its external auditor had resigned, with the resignation to take effect following completion of the audit of the Company's financial report for the year ended 30 June 2026.

The external auditor has subsequently agreed to continue in its role for a further half-year and undertake the review of Northern Minerals' financial report for the six months ending 31 December 2026. The Company will provide a further update on its external audit arrangements as appropriate.

ADMINISTRATION AND CORPORATE EXPENDITURE

Expenditure on administration and corporate activities during the quarter was approximately $3.36 million. Administration and corporate costs incurred during the quarter reflected increased legal, advisory and transaction support activity associated with:

- ongoing shareholder matters relating to the FIRB review and associated beneficial ownership matters;
- engagement with Australian and US Government agencies and advisers in support of project funding initiatives, including associated travel, advisory and lender counsel costs; and
- legal, commercial and technical support associated with project contracts, procurement activities and bankability workstreams.

PAYMENTS TO RELATED PARTIES OF THE ENTITY AND THEIR ASSOCIATES

Payments made during the quarter and included in 6.1 and 6.2 of Appendix 5B – Mining exploration entity quarterly cash flow report are detailed below:

- Aggregate amount of payments to related parties and their associates included in cash flows from operating activities totalled $0.412 million and comprised Executive and Non-Executive Directors' remuneration from services and fees.
- There were no payments to related parties and their associates included in cash flows from investing activities.

ABOUT NORTHERN MINERALS

Northern Minerals Limited (ASX: NTU) (**Northern Minerals** or the **Company**) owns 100% of the Browns Range Heavy Rare Earths Project in the East Kimberley region of Western Australia (the **Project**). The Project's deposits are uniquely rich in the heavy rare earth elements dysprosium (Dy) and terbium (Tb).

Dysprosium and terbium are critical in the production of high-performance neodymium iron-boron (Nd/FeB) magnets used in clean energy, defence, and high technology solutions. Dysprosium and terbium are prized because their unique properties improve the durability of these magnets by increasing their resistance to demagnetisation.

Wolverine is the Company's flagship deposit within the Project and is considered one of Australia's highest-grade dysprosium and terbium deposits. The Company is preparing to bring Wolverine into production with the objective of providing a reliable alternative source of dysprosium and terbium currently supplied from China.

With the completion of the Browns Range Heavy Rare Earth Definitive Feasibility Study, the Company is now progressing project funding discussions to enable the construction of a commercial-scale operation focused on mining and beneficiating ore from the Wolverine deposit, for delivery to Iluka Resources' (ASX: ILU) under-construction rare earths refinery at Eneabba, also in Western Australia.

In addition to Wolverine, Northern Minerals has several additional deposits and prospects within the Project that contain dysprosium and other heavy rare earth elements, hosted in xenotime mineralisation.

FUTURE PERFORMANCE AND FORWARD-LOOKING STATEMENTS

This Report contains certain "forward-looking statements". The words "expect", "anticipate", "estimate", "intend", "believe", "guidance", "should", "could", "may", "will", "predict", "plan" and other similar expressions are intended to identify forward-looking statements. Any indications of, and guidance on, future earnings and financial position and performance are also forward-looking statements. Forward-looking statements, opinions and estimates provided in this Report are based on assumptions and contingencies that are subject to change without notice and involve known and unknown risks and uncertainties and other factors that are beyond the control of Northern Minerals, its directors and management. This includes statements about market and industry trends, which are based on interpretations of current market conditions.

You are strongly cautioned not to place undue reliance on forward-looking statements, particularly in light of the current economic climate and the significant volatility, uncertainty and disruption caused by external factors.

Forward-looking statements are provided as a general guide only and should not be relied upon as an indication or guarantee of future performance. Actual results, performance or achievements may differ materially from those expressed or implied in such statements and any projections and assumptions on which these statements are based. These statements may assume the success of Northern Minerals' business strategies, whether the success is realised in the period for which the forward-looking statement may have been prepared or otherwise. No representation or warranty, express or implied, is made as to the accuracy, likelihood of achievement or reasonableness of any forecasts, prospects, returns or statements in relation to future matters contained in this Report. The forward-looking statements are based on information available to Northern Minerals as at the date of this Report. Except as required by law or regulation (including the ASX Listing Rules), none of Northern Minerals, its representatives or advisers undertakes any obligation to provide any additional or updated information whether as a result of a change in expectations or assumptions, new information, future events or results or otherwise.

Notes to the tenement report:

1 Rare Earth Element rights only

2 Excludes gold rights

No farm-in or farm-out agreements were entered into during the quarter. No tenements were acquired or disposed of by NTU during the quarter.

COMPETENT PERSON'S STATEMENT

The information in this report that relates to the UFF soil sampling exploration results is based on, and fairly represents, information compiled by Kurt Warburton, a full-time employee of Northern Minerals Ltd and a Member of the Australian Institute of Geoscientists. Mr Warburton has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the Australasian Code for the Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code). Mr Warburton consents to the disclosure of the information in this report in the form and context in which it appears.

Appendix 1: Surface geochemical sampling results

Table 2. Surface geochemical sampling results

APPENDIX 2: JORC CODE TABLE 1

SECTION 1: SAMPLING TECHNIQUES AND DATA

Criteria	JORC Code explanation	Commentary
Sampling techniques	Nature and quality of sampling (e.g., cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.	Soil samples: 1,436 new UFF soil samples were collected in the south of the Browns Range Project. UFF Soil samples were collected by digging a hole to a depth of between 15 to 30 centimetres and collecting approximately 200g of material, sieved to -2mm in the field, from the bottom of each hole. Samples were submitted to LabWest in Malaga for multi-element analysis. 50g subsamples were then sieved at the laboratory to the -2um "Ultrafine" fraction for Inductively Coupled Plasma – Mass Spectrometry (ICP-MS) analysis.
	Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.	Soil samples were taken on a consistent grid of 100 m by 100 m to ensure unbiasedness of thematic interpolation mapping, although closer sample spacings were utilized over the Vulcan Prospect. All sampling was carried out under Northern Minerals' sampling protocols in line with the standard UFF sampling protocols developed by LabWest.
	Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g., 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g., submarine nodules) may warrant disclosure of detailed information.	Mineralisation was determined through the Ultrafine soil technique, which utilises a 50 g subsample from which a –2 micron fraction is extracted. The –2 micron fraction then underwent multielement analysis using a multi-acid digest with an ICP-MS or Optical Emission Spectrometry (ICP-OES) finish for a suite of 62 elements. Code (UFF-MMA-04). The method is a partial digest for more resistive / refractory minerals such as xenotime or zircon.
Drilling techniques	Drill type (e.g., core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g., core diameter, triple or standard tube, depth of diamond tails, face-sampling bit, or other type, whether core is oriented and if so, by what method, etc).	There are no drilling results reported with this announcement.
Drill sample recovery	Method of recording and assessing core and chip sample recoveries and results assessed.	There are no drilling results reported with this announcement.
	Measures taken to maximise sample recovery and ensure representative nature of the samples.	There are no drilling results reported with this announcement.

Criteria	JORC Code explanation	Commentary
	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	There are no drilling results reported with this announcement.
Logging	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	Basic Logging of the material sampled is recorded at the time of sampling.
	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.	Logging is qualitative in nature.
	The total length and percentage of the relevant intersections logged.	All samples were logged.
Sub-sampling techniques and sample preparation	If core, whether cut or sawn and whether quarter, half or all cores taken.	There are no drilling results reported with this announcement
	If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.	There are no drilling results reported with this announcement
	For all sample types, the nature, quality, and appropriateness of the sample preparation technique.	There are no drilling results reported with this announcement. The soil sample types are appropriate for defining anomalous mineralisation for further exploration targeting.
	Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.	As a NATA accredited testing authority, the laboratory undertook industry standard QA/QC to ensure sample representivity.
	Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.	Soil samples are not considered to be representative of in situ material.
	Whether sample sizes are appropriate to the grain size of the material being sampled.	Sample sizes taken in the field are in line with LabWest sampling protocols to extract sufficient material for the -2um soil fraction.
Quality of assay data and laboratory tests	The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.	The Ultrafine soil technique utilises a 50g subsample from which a - 2 micron fraction is extracted. The -2 micron fraction then underwent multielement analysis using a multi-acid digest with an ICP-MS or ICP-OES finish for a suite of 62 elements. Code (UFF-MMA-04). The method is a partial digest for more resistive / refractory minerals such as xenotime or zircon.
	For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	Not applicable to the reported UFF soil sample results.

Criteria	JORC Code explanation	Commentary
	Nature of quality control procedures adopted (e.g., standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e., lack of bias) and precision have been established.	Samples were prepared and analysed as per the laboratory's own, standard QA/QC procedures including CRMs and blank material to monitor laboratory performance.
Verification of sampling and assaying	The verification of significant intersections by either independent or alternative company personnel.	Significant intersections are not being reported.
	The use of twinned holes.	There are no drilling results reported with this announcement.
	Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	Sample information collected in the field was initially handwritten onto printed templates. This information was compiled by a Senior Geologist onto an Excel template and verified by the Exploration Manager before being imported to Northern Minerals' SQL database. Electronic copies of the field and data entry templates are stored on the Northern Minerals' network directory.
	Discuss any adjustment to assay data.	No adjustments were made to assays.
Location of data points	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	Final soil sample locations were recorded using handheld Garmin GPS. Expected accuracy is +/ – 5 m for easting and northing.
	Specification of the grid system used.	The grid system used is MGA94 Zone 52. All reported coordinates are referenced to this grid.
	Quality and adequacy of topographic control.	Topographic surfaces were prepared from LiDAR survey data collected in 2013. Ground control was established by contract surveyors, which they consider to be better than 20 cm.
Data spacing and distribution	Data spacing for reporting of Exploration Results.	Soil samples were typically collected on an offset 100m by 100m grid, although closer sample spacings were utilized over the Vulcan prospect.
	Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied	Mineral Resources and Ore Reserves are not being reported.
	Whether sample compositing has been applied	No sample compositing applied prior to laboratory analysis.
Orientation of data in relation to geological structure	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.	Sample points are 1D without orientation and are displayed on 2D plan views.
	If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	There are no drilling results reported with this announcement.

Criteria	JORC Code explanation	Commentary
Sample security	The measures taken to ensure sample security.	Chain of custody was managed by Northern Minerals. Samples were collected on site under supervision of a responsible geologist and stored in bulk bags on site prior to transport by company truck or utility to Halls Creek commercial transport yard. The samples were stored in a secure area until loaded and delivered to LabWest Laboratories in Perth. Laboratory dispatch sheets are completed and forwarded electronically as well as being placed with transported samples. Dispatch sheets are compared against received samples and discrepancies reported and corrected.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	Internal review by the Competent Person and senior geological staff of the sampling techniques, assay data and supporting database did not identify any material issues affecting the use of the data for regional geochemical interpretation and exploration targeting.

SECTION 2: REPORTING OF EXPLORATION RESULTS

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a license to operate in the area.	The soil sampling programs were at the Company's Browns Range Heavy Rare Earths Project approximately 150 km south-east of Halls Creek and adjacent to the Northern Territory border in the Tanami Desert. Soil sampling was completed within recently granted tenement M80/650. Northern Minerals owns 100% of all mineral rights to M80/650. The tenement includes the Wolverine deposit and the proposed Browns Range Heavy Rare Earths Project processing facilities and mining infrastructure. The fully determined Jaru Native Title Claim is registered over the Project area and the fully determined Tjurabalan claim is located in the south of the Project area. The tenure is held with full security, and no impediments are known to operate in the area.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	No previous systematic exploration for REE mineralisation has been completed by other parties prior to Northern Minerals at Browns Range. Regional exploration for uranium mineralisation was completed in the 1980s without success.
Geology	Deposit type, geological setting, and style of mineralisation.	The Browns Range prospects are located on the western side of the Browns Range Dome, a Paleoproterozoic dome formed by a granitic core intruding the Paleoproterozoic Browns Range Metamorphics (meta-arkoses, feldspathic meta-sandstones and schists) and an Archaean orthogneiss and schist unit to the south. The dome and its aureole of metamorphics are surrounded by the Mesoproterozoic Gardiner Sandstone (Birrindudu Group). Since 2010, Northern Minerals has been exploring the project for Unconformity Related Rare Earth Element (URREE) deposits associated with hydrothermal xenotime. The Browns Range xenotime mineralisation is typically hosted in hydrothermal quartz and hematite veins and breccias within the meta-arkoses of the Archaean Browns Range Metamorphics. Various alteration styles and intensities have been observed; namely silicification, sericitisation and kaolinite alteration.
Drill hole information	A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	There are no drilling results reported with this announcement.

Criteria	JORC Code explanation	Commentary
Data aggregation methods	In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g., cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated.	For the soil samples, to illustrate zones of yttrium continuity in figures, assay data were grouped by grade ranges in Figure 8. No cut-off grade has been applied to the soil sample assay results presented in Table 2. No other weighting, averaging, or cutting / capping have been applied to the raw assay results.
Relationship between mineralisation widths and intercept lengths	These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g., 'down hole length, true width not known').	There are no drilling results reported with this announcement. No assumptions between true widths of mineralized zones have been made from the soil sample assay results, and the assays cannot be interpreted as being representative of HREE mineralisation.
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Appropriate tables, maps, sections and figures are included in the report.
Balanced Reporting	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	Soil samples were surveyed using hand-held GPS, which has an accuracy of 5 m.
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples - size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	All substantive data for this announcement has been reported.
Further work	The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large- scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	Extension of the UFF soil sampling program is planned this financial year north of the covered areas displayed in Figure 8. Further work, including validation and subsequent drill testing, for target areas that are not associated with known mineralisation is also required.
